"The first major reference work to investigate the history and vast scope of beer, The Oxford Companion to Beer features more than 1,100 A-Z entries written by 166 of the world's most prominent beer experts"--Provided by publisher. A study of federal sentencing policy as it relates to the possession & distribution of all forms of cocaine. Includes discussions on: the forms, methods of use, & pharmacology of cocaine; cocaine use & public health issues; the distribution & marketing of the drug (including prices, profits & revenues); cocaine & crime; the national legislative & law enforcement response to cocaine; sentencing of cocaine offenders; with conclusion & sentencing revision recommendations. Appendix includes legal challenges to crack cocaine penalties. Extensive bibliography. Charts & tables. Inspired by a postgraduate course the authors have jointly taught at the University of Cambridge since 2001, Peter Harris and David Oliver use their divergent backgrounds (academia and tax practice) to build a conceptual framework that not only makes the tax treatment of complex commercial transactions understandable and accessible, but also challenges the current orthodoxy of international tax norms. Designed specifically for postgraduate students and junior practitioners, it challenges the reader to think about tax issues conceptually and holistically, while illustrating the structure with practical examples. Senior tax practitioners and academics will also find it useful as a means

of refreshing their understanding of the basics and the conceptual framework will challenge them to think more deeply about tax issues. If ever there was a book to respond to the pressure to increase students' test scores, this is it. Published By: The Math Notion www.mathnotion.com In *Illuminating Sanctity*, Maria R. Grasso analyses the twelfth-century vita of Saint Amand. Her discovery and analysis of another set of preliminary drawings related to the miniature cycle demonstrates that a key alteration was made, isolating an important devotional image. The protection of sensitive information against unauthorized access or fraudulent

changes has been of prime concern throughout the centuries. Modern communication techniques, using computers connected through networks, make all data even more vulnerable for these threats. Also, new issues have come up that were not relevant before, e. g. how to add a (digital) signature to an electronic document in such a way that the signer can not deny later on that the document was signed by him/her. Cryptology addresses the above issues. It is at the foundation of all information security. The techniques employed to this end have become increasingly mathematical of nature. This book serves as an introduction to modern cryptographic methods. After a brief survey of classical cryptosystems, it concentrates on three main areas. First of all, stream ciphers and block ciphers are discussed. These systems have extremely fast implementations, but sender and receiver have to share a secret key. Public key cryptosystems (the second main area) make it possible to protect data without a prearranged key. Their security is based on intractable mathematical problems, like the factorization of large numbers. The remaining chapters cover a variety of topics, such as zero-knowledge proofs, secret sharing schemes and authentication codes. Two appendices explain all mathematical prerequisites in great detail. One is on elementary number theory (Euclid's Algorithm, the Chinese Remainder Theorem, quadratic residues, inversion formulas, and continued fractions). The other appendix gives a thorough introduction to finite fields and their algebraic structure. In this groundbreaking book, Adrian Bejan takes the recurring patterns in nature—trees, tributaries, air passages, neural networks, and lightning bolts—and reveals how a single principle of physics, the constructal law, accounts for the evolution of these and many other designs in our world. Everything—from biological life to inanimate systems—generates shape and structure and evolves in a sequence of ever-improving designs in order to facilitate flow. River basins, cardiovascular systems, and bolts of lightning are very efficient flow systems to

move a current—of water, blood, or electricity. Likewise, the more complex architecture of animals evolve to cover greater distance per unit of useful energy, or increase their flow across the land. Such designs also appear in human organizations, like the hierarchical “flowcharts” or reporting structures in corporations and political bodies. All are governed by the same principle, known as the constructal law, and configure and reconfigure themselves over time to flow more efficiently. Written in an easy style that achieves clarity without sacrificing complexity, Design in Nature is a paradigm-shifting book that will fundamentally transform our understanding of the world around us.
