A Simplified Software Architecture for Self-updating Building Information Models (BIM) Dec 20 2022

Building Information Modeling (BIM) is an emerging software technology that is revolutionizing the architecture, engineering, and construction (A/E/C) industry. BIM technology employs "object-based 3D models-containing the physical and functional characteristics of a facility-that serve as a repository for lifecycle information in an open, interoperable format" [1]. The major difference between BIM and Computer-Aided Design/Drafting (CADD) is that the former includes geometry and a plethora of building information while the latter includes only geometry. BIM utilization in the AEC industry has increased due to 1) BIM tools increasing productivity in design tasks; 2) the increasing number of private and government agencies that have instituted BIM requirements; 3) the pervasive use of computer analysis and simulations models; 4) the benefits of BIM as lifecycle management tool. Current literature shows trends of a transition from a "passive"-static model-based-approach to an "active"-dynamic model-based-approach. The active approach requires the integration of BIM with sensors to create "self-updating" building models. Previous research introduces the concept of a self-updating building model ([2], [31], [41]). These systems involve complex software architecture and may perpetuate the problem of software interoperability. This thesis explores the following question: May a similar system be created to synthesize dynamic sensor data while improving upon previous research and simplifying the software architecture? The author describes a prototype system, called LiveBuild, which integrates commercial BIM software with other off-the-shelf software components to create a self-updating building model. LiveBuild is the first self-updating building model that operates as an extension to existing commercial BIM software. Therefore, the transition from static to active building models is as simple as installing a plug-in. LiveBuild may serve as the basis for future research in self-updating building by providing simplified system that is well integrated with state-of-the art commercial design software. Likewise, the prototype is applicable for professional practice by allowing firms to use their existing BIM software to perform "pilot projects" with self-updating technology. The current prototype supports an interface with single commercial BIM software (Autodesk Revit 2009) product however future prototypes may extend both the functions and interfaces for other BIM software.

Integrating Building Information Modeling (BIM) with Custom Software Development During the Design, Construction, and Operation Phases of the Facilities Nov 26 2020

Building Information Modeling (BIM) is a process that provides architecture, engineering, and construction (AEC) professionals the digital twin of physical and functional characteristics of the actual facility that paves the way for more efficiently design, construct and operate. The data volume achieved with the BIM process has the means to coalesce, become information, and opens the doors for the analyzing as never before for the built environment. Although creating a 3D visual representation of the facility is the manifestation of changing ways of working, BIM is the management and analysis of information through the life cycle of the facility. The BIM process can be used to facilitate decisions at the early design stage that have a direct effect on the energy efficiency of buildings. The impact of the two main factors, shape and orientation of the buildings on energy consumption was analyzed and discussed to determine the optimal solution in cold climates. The results for the energy consumption have been presented with the combination of six building shapes with eight orientations, and the study showed the possibility to reduce the energy intensity by approximately 20%. The fourth dimension of the BIM process is the intelligent linking of model elements with time and scheduling related information for monitoring progress of construction activities and improves project management. A data center building has been used as a case study to present the custom-developed add-in for the construction progress visualization method. The method developed made it possible to monitor the progress of the individual model elements for the various states of progress. Beyond the use of BIM during design and construction, there is much to gain in the long run throughout the facilities lifecycle, and the impact of the accumulated information with BIM transcends these phases. Three approaches for the integration of the sensor database with the BIM process have been demonstrated by using the fifth floor of EITC building as a case study to improve the efficiency of facility management (FM). The developed add-in has been created as a common data platform for the visualization of sensor technology and leads to more responsive facility management.

The Impact of Building Information Modelling Aug 24 2020 Construction projects involve a complex set of relationships, between parties with different professional backgrounds trying to achieve a very complex goal. Under these difficult circumstances, the quality of information on which projects are based should be of the highest possible standard. The line-based, two dimensional drawings on which conventional construction is based render this all but impossible. This is the source of some major shortcomings in the construction industry, and this book focuses on the two most fundamental of these: the failure to deliver projects predictably: to the required quality, on time and within budget; and the failure of most firms in the industry to make a survivable level of profit. By transforming the quality of information used in building, BIM aims to transform construction completely. After describing and explaining these problems, the way in which BIM promises to provide solutions is examined in detail. A discussion of the theory and practice of BIM is also provided, followed by a review of various recent surveys of BIM usage in the US, UK and selected European economies. The way in which other industries, including retail and manufacturing, have been transformed by information are explored and compared with current developments in the deployment of BIM in construction. Five case studies from the UK show how BIM is being implemented, and the effects it is having on architects and contractors. This book is perfect for any construction professional interested in improving the efficiency of their business, as well as undergraduate and postgraduate students wishing to understand the importance of BIM.

Digital Transformation of the Design, Construction and Management Processes of the Built Environment Jan 29 2021 This open access book focuses on the development of methods, interoperable and integrated ICT tools, and survey techniques for optimal management of the building process. The construction sector is facing an increasing demand for major innovations in terms of digital dematerialization and technologies such as the Internet of Things, big data, advanced manufacturing, robotics, 3D printing, blockchain technologies and artificial intelligence. The demand for simplification and transparency in information management and for the rationalization and optimization of very fragmented and splintered processes is a key driver for digitization. The book describes the contribution of the ABC Department of the Polytechnic University of Milan (Politecnico di Milano) to R&D activities regarding methods and ICT tools for the interoperable management of the different phases of the building process, including design, construction, and management. Informative case studies complement the theoretical discussion. The book will be of interest to all stakeholders in the building process - owners, designers, constructors, and faculty managers - as well as the research sector.

Building Information Modeling Mar 23 2023 BIM for Structural Engineering and Architecture Building Information Modeling: Framework for Structural Design outlines one of the most promising new developments in architecture, engineering, and construction (AEC). Building information modeling (BIM) is an information management and analysis technology that is changing the role of computation in the architectural and engineering industries. The innovative process constructs a database assembling all of the objects needed to build a specific structure. Instead of using a computer to produce a series of drawings that together describe the building, BIM creates a single illustration representing the building as a whole. This book highlights the BIM technology and explains how it is redefining the structural analysis and design of building structures. BIM as a Framework Enabler This book introduces a new framework—the structure and architecture synergy framework (SAS framework)—that helps develop and enhance the understanding of the fundamental principles of architectural analysis using BIM tools. Based upon three main components: the structural melody, structural poetry, and structural analysis, along with the BIM tools as the frame enabler, this new framework allows users to explore structural design as an art while also factoring in the principles of engineering. The framework stresses the influence structure can play in form generation and in defining spatial order and composition. By highlighting the interplay between architecture and structure, the book emphasizes the conceptual behaviors of structural systems and their aesthetic implications and enables readers to thoroughly understand the art and science of whole structural system concepts. Presents the use of BIM technology as part of a design process or framework that can lead to a more comprehensive, intelligent, and integrated building design Places special emphasis on the application of BIM technology for exploring the intimate relationship between structural engineering and architectural design Includes a discussion of current and emerging trends in structural engineering practice and the role of the structural engineer in building design using new BIM technologies Building Information Modeling: Framework for Structural Design provides a thorough understanding of architectural structures and introduces a new framework that revolutionizes the way building structures are designed and constructed.

This is essential reading for project managers, construction managers, architects, design managers, and anybody with a role in BIM or virtual construction.

BIM for Building Owners and Developers Mar 11 2022 Use BIM to develop strategies, expedite projects, improve outcomes, and save money. BIM is far more than an "upgrade" to the latest CAD software. It is a process improvement tool that leverages data to analyze and predict outcomes throughout the different phases of the building life cycle. The time for a building owner to get involved with the BIM process is not at the end of the building project but from the very beginning. BIM for Building Owners and Developers is the only guide that will help you, the owner and client, use BIM to increase transparency and create a more integrated design and construction process, which will result in better quality buildings at lower cost and in a shorter time frame. It will also help you understand what BIM can do for you and what you can expect in terms of process and commitments. You'll discover how BIM can help improve your strategic planning, maximize ROI, support the decision-making processes, and fine-tune GAP analysis. In addition, BIM for Building Owners and Developers can help you: Understand, manage, and take advantage of the BIM paradigm shift Assemble a building as it would be constructed on site to help eliminate many inefficiencies of the construction process Achieve a high level of coordination through better integration of information and process optimization Reduce the overall cost of a project by identifying problems while they still can be corrected inexpensively Make every project easier, faster, and more profitable with BIM for Building Owners and Developers.

BIM Content Development Jul 15 2022 A must-have reference to create content-rich BIM objects and models A cutting-edge technology, Building Information Modeling (BIM) software allows AEC professionals to produce data-intensive 3D building models that far exceed those rendered with the 2D limitations of CAD, today's industry standard. Unlike CAD, however, no consensus has been reached among AEC industries for agreed upon guidelines directing BIM models. To fill this void, this book explores the different approaches used in designing a BIM model and incorporates them into one cohesive strategy that serves as a digital road map going forward. BIM Content Development: Details the various types of information (graphic and data) that Building Information Modeling (BIM) can gather about a building, such as its dimensions and material, its performance, its functionality, its interaction with other structures, and how often it must be maintained Presents a vendor-neutral approach to thinking about, organizing, and managing data used to create a 3D building model Covers the different methods for organizing content, such as CSI's MasterFormat®, Unifomat, OmniClass, and Industry Foundation Classes (IFC) Providing the means and methods for effective content creation, BIM Content Development offers sound guidance for graphic standards and data management solutions to maximize the ability of professionals to operate on any BIM software platform—and shows how to strengthen the decision-making process to unleash powerful tools for modeling a building's informational profile.

Building Information Modeling Oct 18 2022 The optimal approach to design, build, operate, and maintain buildings With this strategic guide to building information modeling (BIM), you'll learn how to implement this new technology as part of a comprehensive systems approach to the design, construction, management, operation, maintenance, and use of buildings. The authors, among the leading experts and pioneers in BIM, show you how BIM supports more streamlined, integrated, and efficient business processes throughout the lifecycle of buildings, from their initial conception through their eventual retirement or reuse. The result is better quality buildings, lower construction and operating costs, shorter project turnaround times, and a higher quality of building information to support better business decisions. Moreover, they set forth a plan for incorporating BIM into every organization's existing workflows, enabling you to take full advantage of all the benefits that BIM offers. Everything you need to implement a BIM approach is set forth in detail, including: The business case for BIM, demonstrating how it can improve collaboration, facilitate better design and construction, optimize workflow, and help reduce risk Guidance for meeting the challenges of BIM such as an entrenched business culture, the proliferation of BIM tools, and the uneven rates of BIM adoption The "big picture" view showing how your organization can work with business partners and fit into the building life cycle in a BIM-enabled industry Throughout the book, sample documents and figures help you better understand the principles of BIM and how it works in practice. In addition, first-hand accounts show you exactly how adopters of BIM have gained a competitive edge. Architects, engineers, constructors, building owners, and facility managers can turn to this book to realize the full potential of BIM and radically improve the way buildings are designed, built, operated, and maintained.

Building Information Modeling Aug 28 2023 This is a design guide for architects, engineers, and contractors concerning the principles and specific applications of building information modeling (BIM). BIM has the potential to revolutionize the building industry, and yet not all architects and construction professionals fully understand what the benefits of BIM are or even the fundamental concepts behind it. As part of the Pocket Architecture Series it includes two parts: fundamentals and applications, which provide a comprehensive overview of all the necessary and essential issues. It also includes case studies from a range of project sizes that illustrate the key concepts

clearly and use a wide range of visual aids. Building Information Modeling addresses the key role that BIM is playing in shaping the software tools and office processes in the architecture, engineering, and construction professions. Primarily aimed at professionals, it is also useful for faculty who wish to incorporate this information into their courses on digital design, BIM, and professional practice. As a compact summary of key ideas it is ideal for anyone implementing BIM.

New Advances in Building Information Modeling and Engineering Management Apr 12 2022 This book explores the latest advances in the field of building management. Several chapters use new technologies such as the BIM methodology for collecting life cycle information and managing the maintenance of existing buildings, sharing valid historical and architectural heritage data, energy analysis of building envelopes, and planning new buildings or sustainable building practices. In addition, other tools are presented that focus on improving access to BIM information, open-source governance, mobile applications to accelerate information transfer, the use of blockchain, lean design methods, and open-source software to solve critical path problems. Some contributions feature the assessment of occupational risks in construction, as it is necessary to plan preventive measures based on risk assessments integrated throughout the construction process, which is another important element for the management of this sector.

Advances in Building Information Modeling May 21 2020 This book constitutes the refereed proceedings of the First Eurasian BIM Forum, EBF 2019, held in Istanbul, Turkey, in May 2019. The 16 full papers were carefully reviewed and selected from 44 submissions. The papers cover such topics as ?BIM adoption and implementation; BIM for project management; BIM for sustainability and performative design; BIM and facility management and infrastructural issues.

Implementing Successful Building Information Modeling Jul 27 2023 Building Information Modeling (BIM) is the process of generating and managing building data during a building's lifecycle. Today, more and more architectural firms have adopted BIM software and processes because it allows them to produce measurably more work of better quality, in shorter periods of time. Featuring case studies of firms of all sizes, this practical resource shows professionals how to implement BIM in the building industry around the globe. The book explains how BIM allows the data collected to plan, design and build projects to continue to be used and added to during the occupied life of the building. Readers also become knowledgeable about the changing role of architects within the building industry as they embed BIM in their workflow. From interoperability and open standards, knowledge sharing, and gathering data, to the BIM software suite, implementation planning, and project workflow, this authoritative volume provides a thorough understanding of key aspects of BIM that practitioners need to understand.

Real World Applications of BIM in Construction May 13 2022 Real World Applications of BIM in Construction has been written for students in the fields of construction management, construction/architectural technology, civil engineering, and others interested in exploring Building Information Modeling (BIM) as it is actually used in the world of construction. This workbook explores BIM applications of construction processes using simple and easy-to-follow tutorials. It introduces quantity takeoff, cost estimation, clash detection, simple 4-D scheduling and project visualization using common BIM tools. Additionally, the planning aspects to properly implement BIM into a project is introduced. Students and readers will find this text to be an eye-opening first step into how BIM can be used to improve the construction process providing added value to contractors, designers, and owners. This text is intended to be a dynamic workbook with tutorials illustrating the basic processes involved in the applications previously mentioned. Although there is a vast array of BIM-related software available in the marketplace, this workbook has chosen to use software that is both widely adopted with versions that are currently available at no cost to students - including Autodesk's Revit®, Autodesk's Navisworks Manage®, and Trimble's SketchUp Make®. Since most construction project managers have little to no knowledge of how models are created by designers, this workbook focuses only on construction applications related to BIM and assumes that the reader has no previous exposure to BIM software. The workbook comes with a pre-packaged CD containing all the model files the student will need to complete the tutorials and assignments.

Building Information Modelling (BIM) in Design, Construction and Operations II May 25 2023 The papers presented at Building Information Modelling 2017 (BIM) are from a range of forums, including plenary papers, workshops, seminars, and panel sessions. The conference was attended by experts from industry, practice and academia, sharing their work on key topics, the development of innovative solutions, and the identification future trends. The volume gives details of how BIM tools and techniques have fundamentally altered the manner in which modern construction teams operate, the processes through which designs are evolved, and the relationships between conceptual, detail, construction and life cycle stages. BIM is essentially value-creating collaboration throughout the entire life-cycle of an asset, underpinned by the statistics attached to them and has

far and reaching consequences on both building procurement and infrastructure. BIM 2017 papers cover topics such as: BIM in design coordination, Construction operations; Building operation and maintenance; BIM and sustainability; Collaborative working and practices; Facilities management integration and GIS integration; Automation in construction; Health and safety; BIM and interoperability; Life cycle project management; Cultural heritage; BIM and Robotics; Risk analysis and management and Emergency analysis, planning and management

BIM Design Mar 31 2021 Building information modelling (BIM) is revolutionising building design and construction. For architects, BIM has the potential to optimise their creativity while reducing risk in the design and construction process, thus giving them a more significant role in the building process. This book demonstrates how innovative firms are using BIM technologies to move design away from the utilitarian problems of construction, engaging them in a stunning new future in the built environment. Whereas recent books about BIM have tended to favour case-study analyses or instruction on the use of specific software, *BIM Design* highlights how day-to-day design operations are shaped by the increasingly generative and collaborative aspects of these new tools. BIM strategies are described as operations that can enhance design rather than simply make it more efficient. Thus this book focuses on the specific creative uses of information modelling at the operational level, including the creative development of parametric geometries and generative design, the evaluation of environmental performance and the simulation and scheduling of construction/fabrication operations. This book also engages BIM's pragmatic efficiencies such as the conflict checking of building systems and the creation of bills of quantities for costing; and in so doing it demonstrates how BIM can make such activities collaborative. Throughout, projects are used to illustrate the creative application of BIM at a variety of scales. These buildings showcase work by firms executing projects all over the world: SHoP Architects and Construction (New York), Morphosis (Los Angeles), Populous (London), GRO Architects (New York), Reiser + Umemoto (New York), Gensler (Shanghai) and UNStudio (Amsterdam).

Building Information Modeling: Planning and Managing Construction Projects with 4D CAD and Simulations (McGraw-Hill Construction Series) Jul 23 2020 The automotive and aerospace industries have used information modeling techniques for years and now major construction companies are embracing BIM CD-ROM includes software evaluations, links, case studies, exercises, and more

Railway Information Modeling RIM Feb 27 2021 Building Information Modeling (BIM) is the digital and graphical representation of the physical and functional characteristics of a structure. It provides a reliable basis for decisions throughout a building's lifecycle, and with BIM it is possible to design, plan, build and track projects. In particular, BIM has sparked a transformation of the railway sector. *Railway Information Modeling RIM* is a compilation of two years' worth of academic, conceptual and practical research on the integration of BIM into railway. It summarizes and focuses on a survey carried out by the authors, who are experts in the field. The book also contains a literature review and a case study to demonstrate the benefits and sustainability of BIM integration, and finishes with the practical steps and considerations for the successful management of the integration process.
