Methods of construction and building materials have changed so radically that this new book seems called for. Much of my former work has been retained, though my object has been to condense - saving the student's time in these busy days while still following the original plan which was - to furnish to any earnest student the Opportunity to acquire, so far as books will teach, the knowledge necessary to erect safely any building. While of course, the work will be based strictly on the science of mechanics, all useless theory will be avoided. The object will be to make the articles simply practical. To follow any of the mathematical demonstrations, arithmetic, a rudimentary knowledge of algebra and plane geometry will be sufficient. Building construction technology is concerned with the technical performance of buildings, building materials, and building construction systems. Technological progress has introduced many innovations in the field of construction industry. The building construction technology covers a wide range of modern techniques and practices that encompass the latest developments in materials technology and their applications, design procedures, quantity surveying, structural analysis and design, the functioning of components and systems, procedures and details of building assembly; operating strategies and so on. The adoption of advanced construction technology requires an appropriate design, commitment from the whole project team, suitable procurement strategies, good quality control, appropriate training and careful commissioning. There is a difference between new and old traditional construction methods. The use of machinery and automation has made its way through the civil engineering and

construction industry. Most of the building components such as columns, roofs and concrete blocks are available as prefabricated forms that increase the speed of construction process greatly. In the rapidly changing scenario of building sector, architects, engineers and builders should search for new construction technologies to adopt in future constructions that benefits like energy efficiency, resources and water conservation, improved indoor air quality, life cycle cost reduction, durability and low maintenance. Therefore, to attain these objectives, application and knowledge of latest advancements in various technologies are of prime concern. This book 'Advances in Building Construction Technology' contains six chapters which introduces various scientific methods and state-of-the-art building construction technologies and systems that may be beneficial to architects, engineers, building scientists and construction industry professionals. Many areas of knowledge converge in the building industry and therefore research in this field necessarily involves an interdisciplinary approach. Effective research requires strong relation between a broad variety of scientific and technological domains and more conventional construction or craft processes, while also considering advanced management processes, where all the main actors permanently interact. This publication takes an interdisciplinary approach grouping various studies on the building industry chosen from among the works presented for the 2nd International Conference on Construction and Building Research. The papers examine aspects of materials and building systems; construction technology; energy and sustainability; construction management; heritage, refurbishment and conservation. The information contained within these pages may be of interest to researchers and practitioners in construction and building activities from the academic sphere, as well as public and private sectors. This book comprises a first survey of the Collaborative Research Center SFB-TRR 141 'Biological Design and Integrative Structures – Analysis, Simulation and Implementation in Architecture', funded by the Deutsche Forschungsgemeinschaft since October 2014. The SFB-TRR 141 provides a collaborative framework for architects and engineers from the University of Stuttgart, biologists and physicists from the University of Freiburg and geoscientists and evolutionary biologists from the University of Tübingen. The program is conceptualized as a dialogue between the disciplines and is based on the belief that that biomimetic research has the potential to lead everyone involved to new findings far beyond his individual reach. During the last few decades, computational methods have been introduced into all fields of science and technology. In architecture, they enable the geometric differentiation of building components and allow the fabrication of porous or fibre-based materials with locally adjusted physical and chemical properties. Recent developments in simulation technologies focus on multi-scale models and the interplay of mechanical phenomena at various hierarchical levels. In the natural sciences, a multitude of quantitative methods covering diverse hierarchical levels have been introduced. These advances in computational methods have opened a new era in biomimetics: local differentiation at various scales, the main feature of natural constructions, can for the first time not only be analysed, but to a certain extent also be transferred to building construction. Computational methodologies enable the direct exchange of information between fields of science that, until now, have been widely separated. As a result they lead to a new approach to biomimetic research, which, hopefully, contributes to a more sustainable development in architecture and building construction.
