Model Neural Networks and Behavior Mar 15 2022 The most conspicuous function of the nervous system is to control animal behavior. From the complex operations of learning and mentation to the molecular configuration of ionic channels, the nervous system serves as the interface between an animal and its environment. To study and understand the fundamental mechanisms underlying the control of behavior, it is often both necessary and desirable to employ biological systems with characteristics especially suitable for answering specific questions. In neurobiology, many invertebrates have become established as model systems for investigations at both the systems and the cellular level. Large, readily identifiable neurons have made invertebrates especially useful for cellular studies. The fact that these neurons occur in much smaller numbers than those in higher animals also makes them important for circuit analysis. Although important differences exist, some of the questions that would be technically impossible to answer with vertebrates can become experimentally tractable with invertebrates.

Automata, Languages and Programming Jan 01 2021 In subvolume 27C1 magnetic and related properties of binary lanthanide oxides have been compiled. This subvolume covers data obtained since 1980 and can therefore be regarded as supplement to volume III/12c. While in the previous volume the majority of magnetic data was obtained either from magnetometric measurements or from neutron diffraction, for the present data the main emphasis is devoted to 'related' properties without which, however, the understanding of classical magnetic properties is impossible. A second part 27C2 will deal with binary oxides of the actinide elements.
