A Registry of My Passage upon the Earth Jun 16 2022 A Pulitzer Prize Finalist: This collection of moving short stories is “a treasure trove of lush scene setting in faraway times and places” (Alexis Burling, San Francisco Chronicle). On a fateful flight, a balloonist makes a discovery that changes her life forever. A telegraph operator finds an unexpected companion in the middle of the Amazon. A doctor is beset by seizures, in which he is possessed by a second, perhaps better, version of himself. And in Regency London, a bare-knuckle fighter prepares to face his most fearsome opponent, while a young mother seeks a miraculous cure for her ailing son. At times funny and irreverent, always moving and deeply urgent, these stories—among them a National Magazine Award and a Pushcart Prize winner—cap a fifteen-year project. From the Nile's depths to the highest

reaches of the atmosphere, from volcano-racked islands to an asylum on the outskirts of Rio de Janeiro, these are tales of ecstasy, epiphany, and what the New York Times Magazine called the "struggle for survival . . . hand to hand, word to word," by "one of the finest prose stylists in American fiction." Buildings of Spherical Type and Finite BN-Pairs Sep 07 2021 These notes are a slightly revised and extended version of mimeographed notes written on the occasion of a seminar on buildings and BN-pairs held at Oberwolfach in April 1968. Their main purpose is to present the solution of the following two problems: (A) Determination of the buildings of rank $>$; and irreducible, spherical type, other than \sim and H ("of spherical type" means "with finite Weyl 4 group", about the excluded types H, cf. the addenda on p. 274). Roughly speaking, those buildings all turn out to be associated to simple algebraic or classical groups (cf. 6. ; 6. 1; 8. 4. ; 8. 22, 9. 1, 10. 2). An easy application provides the enumeration of all finite groups with BN-pairs of irreducible type and rank $>$; up to normal subgroups contained in B (cf. 11. 7). (B) Determination of all isomorphisms between buildings of rank > 2 and spherical type associated to algebraic or classical simple groups and, in particular, description of the full automorphism groups of such buildings (cf. 5. 8, 5. 9, 5. 10, 6. 6, 6. 1; 8. 6, 9. ; 10. 4). Except for the appendices, the notes are rather strictly oriented - ward these goals.

Dynamic Climatology Nov 21 2022 This book is an introduction to the concepts behind the popular understanding of climate and global warming. The author provides readers with a survey and reference to the subject to be used before, during and after they delve into the details of statistics, dynamics and thermodynamics. Dynamic Climatology reviews the basic concepts in the study of dynamic climatology, their expression in the form of equations and the physics of models used to reproduce the weather phenomena of a specific location. It takes a historical approach concentrating on the development of ideas during the last four hundred years. Unlike most books in this field, which are devoted to a single aspect of dynamic climatology, the intent of this volume is to present a coherent narrative of the different components of climate thus providing a solid basis of understanding.

Basic Thermodynamics Jan 29 2021 The book presents a clear and simple exposition of thermodynamic principles to enable beginners to penetrate its fundamental ideas buried under a haze of abstractness and to appreciate the logical development of thermodynamic reasoning. Since thermodynamics often proves conceptually difficult for the beginner, care has been taken to present a clear and simple but comprehensive account of its principles. Applications in various branches of physics (phase transitions, low temperature physics, thermal radiation, power and refrigeration cycles) have been treated in some detail. Worked examples and a set of problems accompany each chapter.

Basic Engineering Thermodynamics Sep 19 2022 Engineering thermodynamics is the study of and practical application of the successful conversion of heat energy into work energy, a transformation fundamental to the existence of our modern industrial society. The thermodynamic conversion

process lies behind the operation of the internal combustion engine and the generation of power. Transport systems - such as the motor cars, aircraft and railway trains - can only function because of this process; it also makes possible the generation of the electricity, supplying energy for heating, lighting and computing, and many other processes essential to the modern world. Basic Engineering Thermodynamics, first published in 1960, provides a comprehensive introduction to the principles and application of the subject. The fifth edition has been extensively revised and updated with a new chapter on basic psychrometry and additional material and re-drawn illustration throughout. This is a core text for BTEC HNC/D and degree courses in mechanical engineering.

The Large Scale Structure of Space-Time Jan 12 2022 Einstein's General Theory of Relativity leads to two remarkable predictions: first, that the ultimate destiny of many massive stars is to undergo gravitational collapse and to disappear from view, leaving behind a 'black hole' in space; and secondly, that there will exist singularities in space-time itself. These singularities are places where space-time begins or ends, and the presently known laws of physics break down. They will occur inside black holes, and in the past are what might be construed as the beginning of the universe. To show how these predictions arise, the authors discuss the General Theory of Relativity in the large. Starting with a precise formulation of the theory and an account of the necessary background of differential geometry, the significance of space-time curvature is discussed and the global properties of a number of exact solutions of Einstein's field equations are examined. The theory of the causal structure of a general space-time is developed, and is used to study black holes and to prove a number of theorems establishing the inevitability of singularities under certain conditions. A discussion of the Cauchy problem for General Relativity is also included in this 1973 book.

The Silicon Web Dec 11 2021 The technology behind computers, fiber optics, and networks did not originate in the minds of engineers attempting to build an Internet. The Internet is a culmination of intellectual work by thousands of minds spanning hundreds of years. We have built concept upon concept and technology upon technology to arrive at where we are today, in a world constructed of silicon pathways and controlled by silicon processors. From computers to optical communications, *The Silicon Web: Physics for the Internet Age* explores the core principles of physics that underlie those technologies that continue to revolutionize our everyday lives. Designed for the nonscientist, this text requires no higher math or prior experience with physics. It starts with an introduction to physics, silicon, and the Internet and then details the basic physics principles at the core of the information technology revolution. A third part examines the quantum era, with in-depth discussion of digital memory and computers. The final part moves onto the Internet era, covering lasers, optical fibers, light amplification, and fiber-optic and wireless communication technologies. The relation between technology and daily life is so intertwined that it is impossible to fully understand modern human experience without having at least a basic understanding of the concepts and history behind modern technology, which continues to become more prevalent as well as more ubiquitous. Going beyond the technical, the book also looks at ways in which science has changed the course of history. It clarifies common misconceptions while

offering insight on the social impacts of science with an emphasis on information technology. As a pioneering researcher in quantum mechanics of light, author Michael Raymer has made his own significant contributions to contemporary communications technology

Sacred Economics Mar 02 2021 Sacred Economics traces the history of money from ancient gift economies to modern capitalism, revealing how the money system has contributed to alienation, competition, and scarcity, destroyed community, and necessitated endless growth. Today, these trends have reached their extreme—but in the wake of their collapse, we may find great opportunity to transition to a more connected, ecological, and sustainable way of being. This book is about how the money system will have to change—and is already changing—to embody this transition. A broadly integrated synthesis of theory, policy, and practice, Sacred Economics explores avant-garde concepts of the New Economics, including negative-interest currencies, local currencies, resource-based economics, gift economies, and the restoration of the commons. Author Charles Eisenstein also considers the personal dimensions of this transition, speaking to those concerned with "right livelihood" and how to live according to their ideals in a world seemingly ruled by money. Tapping into a rich lineage of conventional and unconventional economic thought, Sacred Economics presents a vision that is original yet commonsense, radical yet gentle, and increasingly relevant as the crises of our civilization deepen.

Synoptic and Dynamic Climatology May 23 2020 Synoptic and Dynamic Climatology provides the first comprehensive account of the dynamical behaviour and mechanisms of the global climate system and its components, together with a modern survey of synoptic-scale weather systems in the tropics and extratropics, and of the methods and applications of synoptic climate classification. It is unrivalled in the scope and detail of its contents. The work is thoroughly up to date, with extensive bibliographies by chapter. It is illustrated with nearly 300 figures and plates. *Part 1 provides an introduction to the global climate system and the space-time scales of weather and climate processes, followed by a chapter on climate data and their analysis *Part 2 describes and explains the characteristics of the general circulation of the global atmosphere and includes the nature and causes of global teleconnection patterns *Part 3 discusses synoptic weather systems in the extratropics and tropics and satellite-based climatologies of synoptic features. It also describes the applications of synoptic climatology and summarises current climatic research and its directions.
