A Prelude to a Third Dimension of the Periodic Table: Superatoms of Aluminum Iodide Clusters Jan 29 2021 Calculations have been carried out to investigate the stability and electronic structure of aluminum iodide clusters using first principles gradient-corrected density functional theory. Analysis of Al13x -, Al14Ix -, and Al7I - clusters reveals that their stability is governed by the geometrically unperturbed Al13-, Al142+, and Al17+ units, respectively, that are demonstrated to constitute the compact cores of the clusters upon significant iodine content. The compact, icosahedral Al13, icosahedral-like Al14, and capped square bi-pyramid Al7 superatom structures of the stable aluminum cores have an analogous electronic configuration to that of halogen, alkaline-earth, and alkaline atoms, respectively. Novel chemistry is demonstrated in superatoms, arising from two primary sources. Firstly, the calculations demonstrate the preference to break molecular I2 bonds in favor of iodine atoms individually adsorbing onto the aluminum sites of the central aluminum core surface. Secondly, the calculations show that observations of alternating stability trends dependent on the number of iodine ligands are connected to the formation and quenching of active sites. The significance of the induced active centers on aluminum iodide clusters upon association to alkenes is addressed, demonstrating a method towards predicting the location and extent of binding hydrocarbons. The novel chemistry of superatoms allows for a host of possible applications that integrate their unique properties in original ways and some key examples are described. Superatoms are the analogs to atoms and subsequently, just as the periodic table of elements lists atoms that can assemble into molecules and lattice structures, there exists the fathomable possibility to incorporate superatoms into extended structures such that they maintain their unique properties and result in a new class of materials. Initiation of such cluster-materials insinuates that a cluster-mediated periodic table may be a proper extension to allow for a simple means for conveying fundamental information about clusters.

The Effect of Baseline Cluster Stratification on the Power of Pre-post Analysis Sep 07 2021 The purpose of study is to check whether the power of detecting the effect of intervention versus control in a pre- and post-study can be increased by using a stratified randomized controlled design. A stratified randomized controlled design with two study arms and two time points, where strata are determined by clustering on baseline outcomes of the primary measure, is considered. A modified hierarchical clustering algorithm is developed which guarantees optimality as well as requiring each cluster to have at least one subject per study arm. The power is calculated based on simulated bivariate normal distributed primary measures with mixture normal distributed baseline outcomes. The simulation shows that the power of this approach can be increased compared with using a completely randomized controlled study with no stratification. The difference of the power between with stratification and without stratification increases as the sample size increases or as the correlation of the pre- and post-measures decreases.

Clusters Bridging Disciplines Jul 26 2020 Clusters constitute an intermediate state of matter between molecules and solids whose properties are size dependent and can be tailored. In recent years, cluster science has become one of the most exciting areas of research since their study can not only bridge our understanding between atoms and their bulk but also between various disciplines. In addition, clusters can serve as a source of new materials with uncommon properties. This dissertation deals with an in-depth study of clusters as a bridge across physics, chemistry, and materials science and provides a fundamental understanding of the structure-property relationships by focusing on three different topics. The first topic deals with superatoms which are clusters that mimic the chemistry of atoms. I show that superhalogens and superalkalis can be designed to mimic the chemistry of halogen and alkali atoms, respectively. An entirely new class of salts can then be synthesized by using these superatoms as the building blocks. I have also explored the possibility of designing highly electronegative species called hyperhalogens by using superhalogens as ligands or superalkalis as core and a combination of both. Another aspect of my work on superatom is to examine if traditional catalysts (namely Pd) can be replaced by clusters composed of earthabundant elements (namely Zr and O). This is accomplished by comparing the electronic structure and reactivity of Pd clusters with isoelectronic ZrO clusters. The second topic deals with a study of the electronic structure of coinage metal (Cu and Ag) clusters and see if they remain unchanged when a metal atom is replaced by an isoelectronic hydrogen atom as is the case with Au-H clusters. The third topic deals with clusters as model of polymeric materials to understand their gas storage and sequestration properties. This is accomplished by studying the trapping of H2, CO2, CH4 and SO2 molecules in borazine-linked polymers (BLPs) and benzimidazole-linked polymers (BILPs). The first two topics provide a bridge between physics and chemistry, while the third topic provides a bridge to materials science.

The Structure and Stability of Cationic Metal-benzene Clusters Oct 28 2020 We have investigated the size-dependent stability and structure of benzene, aluminum-benzene, and vanadium-benzene clusters. Motivated by gas-phase experimental studies performed by an experimental collaborator, we have used first-principle electronic structure methods to identify the structure of Al(Bz)_[subscript n], V+(Bz)_n, and Bz_[subscript n] clusters. Our studies reveal that cationic aluminum-benzene clusters have a magic number of 13, and that its high stability may be understood by analyzing the structure of the cluster. We also investigate the structure of vanadium-benzene clusters which have a magic number of 2. Here I examine the benzene-cation and benzene-benzene interactions that lead to these magic numbers, as well as their geometric shell structures and their formation/solvation.

Verb Sense Discovery in Mandarin Chinese—A Corpus based Knowledge-Intensive Approach Jul 06 2021 This book applies linguistic analysis to the poetry of Emeritus Professor Edwin Thumboo, a Singaporean poet and leading figure in Commonwealth literature. The work explores how the poet combines grammar and metaphor to create meaning, making the reader aware of the linguistic resources developed by Thumboo as the basis for his unique technique. The author approaches the poems from a functional linguistic perspective, investigating the multiple layers of meaning and metaphor that go into producing these highly textured, grammatically intricate verbal works of art. The approach is based on the Systemic Functional Theory, which aids the study of how the poet uses language (grammar) to craft his text in a playful way that reflects a love of the language. The multilingual and multicultural experiences of the poet are considered to have contributed to his uniquely creative use of language. This work demonstrates how the Systemic Functional Theory, with its emphasis on exploring the semogenic (meaning-making) power of language, provides the perspective we need to better understand poets' works as intentional acts of meaning. Readers will discover how the works of Edwin Thumboo illustrate well a point made by Barthes, who noted that "Bits of code, formulae, rhythmic models, fragments of social languages, etc. pass into the text and are redistributed within it, for there is always language before and around the text." With a focus on meaning, this functional analysis of poetry offers an insightful look at the linguistic basis of Edwin Thumboo's poetic technique. The work will appeal to scholars with an interest in linguistic analysis and poetry from the Commonwealth and new literature, and it can also be used to support courses on literary stylistics or text linguistics.

Cities in the Commonwealth Oct 21 2022 From the 1780s, when Louisville and Lexington were tiny clusters of houses in the wilderness, to the 1980s, when more than half of all Kentuckians live in urban areas, the growth of cities has affected nearly all aspects of life in the Commonwealth. These urban centers have led the state in economic, social, and cultural change. Cities in the Commonwealth examines the crises that have shaped the history of Kentucky's cities and sheds light on such continuing concerns as urban competition, provision of essential services, the importance of the arts, and the struggle for racial justice. By allowing contemporaries to tell much of the story in their own words, Allen J. Share conveys a sense of the exuberance and dynamism of urban life and thought in Kentucky.

Clusters and Nano-Assemblies Mar 26 2023 While the field of clusters and nano-structures in the physical sciences has been actively pursued only over the past two decades, nature has known the benefits of the nanoscale for a very long time. The focus of the International Symposium on Clusters and Nano-Assemblies: Physical and Biological Systems was to explore ways in which an understanding of the unique properties of nano-scale biological systems such as proteins, enzyme reactions, RNA, and DNA can help us design novel materials composed of inorganic nano-scale systems, and how techniques developed in the physical sciences can lead to a fundamental understanding of biological systems. Bringing together the expert contributions from the conference, this book deals with the fundamental science and technology of atomic clusters, nano-structures and their assemblies in physical and biological systems. It explores in fascinating detail the manner in which finite size, low dimensionality, and reduced symmetry affect the properties of nano-assemblies. Symptom Clusters in Lung Cancer Patients Sep 27 2020 The purpose of the study was to examine selected relationships among symptoms common to individuals with lung cancer. The specific aims were: 1) To examine the relationship between the symptoms of dyspnea and anxiety in patients with lung cancer. 2) To examine the relationships among the symptoms of dyspnea, anxiety, and symptom cluster components (depressive symptoms, fatigue, pain) in patients with lung cancer. 3) To examine the correlation between functional ability and quality of life in patients with lung cancer. 4) To explore the relationships among the symptoms of dyspnea, anxiety, and symptom cluster components (depressive symptoms, fatigue, pain) in patients with lung cancer and patients' functional ability. 5) To explore the relationships among the symptoms of dyspnea, anxiety, and symptom cluster components (depressive symptoms, fatigue, pain) in patients with lung cancer and patients' quality of life. Data were gathered through online survey and analyzed using descriptive, correlation, principal component analysis, exploratory factor analysis, and forward stepwise regression techniques. A strong positive correlation was found between dyspnea and anxiety (both anxiety in general and anxiety at the time the survey was completed. While results of this study cannot provide conclusive evidence of the existence of a symptom cluster composed of depressive symptoms, fatigue, and pain, the results are consistent with other studies in this area. Significant positive correlations among these three symptoms indicate that this is a possible symptom cluster experienced by lung cancer patients in general. This study provides preliminary data on how these symptoms are related and how they affect functional ability, or the ability to perform routine activities of daily living (ADLS) and instrumental activities of daily living (IADLS), and quality of life in patients with lung cancer. Further study is needed on to better understand the symptom experience of these individuals in order to develop robust interventions targeting effective symptom management.

Am I a Terrorist? Oct 09 2021 'Am I A Terrorist?' is a book of poems that starts with a chilling introductory poem of a terrorist who is all set to murder many innocent people in cold blood. However, the terrorist's plot is unveiled and he is caught by the authorities. He ends up winning a medal for his country at the Commonwealth Games, a feat that brings him laurels. The remaining poems deal with the trials of war, life and optimism, patriotism, humanity and freedom. There is a second section in which the poet brings out her love for Mother Nature, describing how mankind should protect the world they live in, by treating it as a gift and an asset.

Density Functional Studies of the Stability of Clusters Mar 14 2022 Theoretical studies using the Kohn-Sham density functional formalism have been carried out to identify and investigate the stability of a variety of atomic clusters for their use in cluster assembled materials. The stable behavior found in a cluster system provides a way to classify inorganic clusters. The clusters in this study can be categorized in one of the following, jellium, all-metal aromatic, Zintl analogue or as a covalent metal-carbide. By understanding the electronic structure and ultimately the stable nature of a cluster first, it is proposed one can construct assemblies based on the stable cluster. The methodology presented is a viable way to design future nanomaterials with a variety of architectures and precise control over properties based on stable cluster motifs.

Inducing Active Sites in Clusters Dec 11 2021 Size selective reactivity has been observed in pure aluminum cluster anions as a result of Lewis acid and base pairs. Using this a starting point, the goal of this study has been to explore how reactivity is affected with the addition of one or more ligand, which may induce active sites on the surface of the metal clusters. To study this, a theoretical investigation was undertaken on Al13Ix- and Al14Iy- (x=0-2, y=2-4) and their reactivity with methanol. The hypothesis was that iodine can induce a Lewis base site on the opposite side of the cluster, which may enhance reactivity. In results that are consistent with preliminary experimental data, it was found that the Al13Ix- series has a large energy barrier with respect to the cleavage of the O-H bond of methanol. The clusters of the series act as an extremely poor Lewis acids, and as a result, these clusters are relatively inert to methanol etching. On the other hand, the Al14Iy- series has a low barrier and is expected to react rapidly with methanol. The series is found to be most reactive at an aluminum adatom that is bound to an iodine due to the iodine extracting charge from the aluminum cluster creating a strong Lewis acid site.

Nature of Bonding in Bimetallic Or Ligated Aluminum Clusters Apr 22 2020 In this study, Amsterdam Density Functional software is used to model bimetallic and ligated aluminum clusters. The stability of the bimetallic clusters is well described by the Jellium model, and the nature of bonding between dopants and aluminum in the bimetallic clusters is analyzed using different criteria. We find that sodium tends to bind ionically, while the bonding of magnesium is not so obvious. We also determine that examining the Mulliken population is the most useful parameter in differentiating bonding character. Calculations on ligated aluminum clusters reveal it behaves fundamentally different than the bimetallic clusters studied in the first part. The ligated clusters contained a high HOMO-LUMO gap regardless of size and the aluminum showed a high 3p Mulliken population. These results show ligated aluminum clusters behave according to Wade-Mingos counting rules.
