*100 Years of Human Chorionic Gonadotropin* Mar 18 2023 100 years of Human Chorionic Gonadotropin: Reviews and New Perspectives is a collection of articles written by some of the world's leading experts on the pregnancy hormone and cancer marker hCG. In 2019 it is difficult to ignore the effect that our understanding of hCG has had on the lives of millions of people worldwide. The hCG immunoassay, in one form or another, is now one of the most common medical tests conducted and is often the first indication that a mother-to-be is pregnant. Not only a marker of pregnancy, hCG is utilized in the diagnosis and monitoring in oncology and presents a potential target for novel cancer therapeutics. 100 years ago, in 1919, Hirose was demonstrating gonadotropic functions which resulted from a chorionic factor. Over the last century this factor has become defined as hCG and more recently explored as not one molecule but a group of molecules with variable structure and variable functions in both pregnancy and cancer. hCG is a multi-faceted molecule that has clinical and therapeutic implications but can be a challenging topic for researchers

and physicians alike. This text covers the different structures and functions of hCG exploring the genes and evolution of the molecule, the different protein and glycosylation structures which can exist and their effect on structure, detection and quantification. 100 Years of hCG is not an attempt to recount the history of every publication on hCG, but rather a collection of reviews and new perspectives by "hCG-ologists", the term used by Husa to describe biochemists working on HCG in the first book written on the topic over 30 years ago. Some of the authors have been around a while, some not so long, but others are just beginning their journey with a most beguiling molecule. Provides updated information on a complex and changing subject in five sections Reviews historical perspectives and developments over the last 100 years Includes novel insights into the structure, function and detection of hCG in pregnancy and cancer Includes chapters on the use of mass spectrometry to detect and quantify hCG as well as traditional immunoassays and over the counter pregnancy tests Describes the role of hCG in pregnancy, endometrial receptivity and embryo implantation and the use in fertility treatment Addresses the specific hyperglycosylated hCG test that can distinguish a normal term from a failing pregnancy and also screen for preeclampsia and gestational hypertension in pregnancy as well as its use as a marker and treatment target in cancer. Includes chapters on the development and use of hCG vaccines Includes a section on hCG and in subunits in cancer

*Thinking "outside the Box"* May 20 2023 Increasing numbers of biomedical products have become eligible for over-the-counter sale in contemporary American consumer culture. What was once the realm of the clinical has moved into the realm of the domestic, with the consumer as the interpreter of health issues and communication. This dissertation examines the user experience with the marketing and design of packaging of home pregnancy tests. Studies indicate that more than one-third of women of reproductive age in the U.S. have used a home pregnancy test, yet the test is marketed

to a specific demographic of user: one who is white, affluent, and married. How are user experiences affected, and how do different methodological frameworks yield results for the study of these user experiences? In this project, I conduct a series of methodological case studies to show how each reveal various aspects of the user experience of home pregnancy testing. I begin with a case study of three brands of home pregnancy tests, using visual-material rhetorical analysis to uncover the cultural values implicit in packaging. I then move to two case studies involving the results of a National Institutes of Health survey of pregnancy test users. I employ a thematic analysis framework to analyze demographic information about users and to contextualize their narratives. I also conduct corpus linguistics and semantic network analysis with the same data set to model patterns in language. From these varying approaches, each with different underlying assumptions, nuanced aspects of the user experience with the product and its communication emerge. For example, the users' life circumstances change from initial to subsequent pregnancy test purchase and use so as to suggest more desire for a positive result with subsequent testing, yet many users across these categories express some degree of discomfort when purchasing this product. I conclude with suggestions based on this research for more ethically informed pregnancy test marketing, and outline avenues for future research for evaluation of home pregnancy test user experience. I finally discuss the implications of multiple methodological approaches for transdisciplinary humanities project design, implementation, and evaluation, with emphasis on the digital and medical humanities.

*Screening for Chlamydial Infection* Apr 14 2020 **OBJECTIVES:** To examine data on the effectiveness of screening for chlamydial infection by a physician or other health care professional. Specifically, we examine the evidence on the effectiveness of screening strategies in nonpregnant women, pregnant women, and men; the accuracy of tests used for screening; and evidence that early treatment of chlamydial infection improves health outcomes. This review updates the literature since the last recommendation of the U.S. Preventive Services Task Force (USPSTF) published in 1996. **SEARCH STRATEGY:** We searched the topic of chlamydia in the MEDLINE, HealthSTAR, and Cochrane Library databases from January 1994 to November 1999, and supplemented the search by use of reference lists of relevant articles and from experts in the field. Cost studies were searched in the same databases from January 1989 to November 1999. **SELECTION CRITERIA:** A single reader reviewed all English abstracts. Papers were selected for full review if they were about Chlamydia trachomatis genitourinary infections in non-pregnant women, pregnant women, or men and were relevant to key questions in the analytic frameworks or related to cost. Papers published before 1994 were cited if they were important to the interpretation of more recent papers. Investigators read the full-text version of the retrieved papers and applied additional eligibility criteria. For all topics, we excluded articles if they did not provide sufficient information to determine the methods for selecting subjects and for analyzing data. **DATA COLLECTION AND ANALYSIS:** We systematically reviewed 3 types of studies about screening in nonpregnant women that relate to 3 key questions: (1) studies about the effectiveness of screening programs in reducing prevalence rates of infection, (2) studies about risk factors for chlamydial infection in women, and (3) studies about chlamydia screening tests in women. Our search found too few studies on pregnant women to create evidence tables, although pertinent studies are described in the text of the report. We systematically reviewed 2 types of studies about screening in men: (1) studies about prevalence rates and risk factors for chlamydial infection for men and (2) studies about chlamydia screening tests in men. We systematically reviewed cost studies related to screening women. We restricted our review to cost-effectiveness and cost-benefit studies. We reviewed 2 types of studies: (1) studies in which selective to universal screening were compared and (2) studies in which chlamydia screening tests were compared. **MAIN RESULTS:** Nonpregnant women: The initiation of screening programs in multiple settings and communities is associated with declines in chlamydial infection prevalence rates in the populations they serve. Changes in population prevalence rates have not been well documented since few studies have employed a representative population sample. Age continues to be the best predictor of

chlamydial infection in women, with most studies evaluating cutoffs at age younger than 25 years. Other risk factors may be useful predictors, but these are likely to be population specific. To determine the accuracy of screening tests for women, we retrieved and critically reviewed 33 papers on test performance. Results indicate that when DNA amplification tests are used, cervical swab specimens and first void urine specimens have similar and have better sensitivity than endocervical culture. The results of a randomized controlled trial conducted in a large health maintenance organization indicate that screening women selected by a set of risk factors reduces the incidence of pelvic inflammatory disease (PID) for a 1-year period. Recurrent chlamydial infections in women have been associated with increased risks for PID and ectopic pregnancies. Pregnant women: Few previous studies described risk factors for chlamydial infection in pregnant women, and these tended to be small and descriptive. Nonculture-testing techniques appear to perform well in pregnant populations, although studies are limited. A Cochrane review of 11 trials of interventions for treating genital chlamydia infection in pregnancy concluded that amoxicillin was as effective as erythromycin for achieving microbiological cure. The second Task Force recommendations for screening pregnant women were based on 2 studies in which improved pregnancy outcomes were demonstrated after patients were treated for chlamydial infection. We identified no recent studies on this topic in our literature search. Men: Studies of prevalence rates and risk factors for chlamydial infection in men are limited. Being younger than 25 years of age is the strongest known risk factor cited so far. Results of swab specimens compared with first void urine specimens were similar for DNA amplification tests. DNA amplification techniques offer improved sensitivity and are more readily available than culture. The results of clinical trials indicated that azithromycin and doxycycline are equally efficacious, and both are more efficacious than erythromycin. Despite better compliance with single-dose treatment with azithromycin than multiple-dose treatment with doxycycline, cure rates are similar. No studies described the effectiveness of screening or early treatment for men in reducing transmission to women or in preventing acute infections or complications in men. Cost: We retrieved 8 cost-effectiveness or cost-benefit analyses that either compared universal versus selective screening or evaluated the efficiency of various screening tests in women. Screening programs for detecting and treating chlamydia in women may provide cost savings in populations with moderate to high prevalence of chlamydia infection. Selective screening is more cost-effective than universal screening under most assumptions. Universal screening may be cost effective in certain populations in which the prevalence of chlamydia is high or the sensitivity of the selective screening criteria is low. If current estimates of the accuracy of DNA amplification assays are reasonable, these tests may improve the cost effectiveness of chlamydia screening. The cost effectiveness of screening for pregnant women, by use of selective screening criteria and new tests, is uncertain. CONCLUSIONS: Evidence for the effectiveness of screening nonpregnant women at risk has improved since the last recommendations from the USPSTF. There is growing evidence for the high performance of the new DNA amplification tests in which either endocervical swabs in women, urethral swabs in men, or urine specimens from men and women are used. No studies were found that described the effectiveness of screening or early treatment for men in reducing transmission to women or in preventing acute infections or complications in men. KEYWORDS: Chlamydia trachomatis - screening - risk factors - screening tests. **Management of Unintended and Abnormal Pregnancy** Jun 09 2022 Access to high quality abortion care is essential to women's health, as evidenced by the dramatic decrease in pregnancy-related morbidity and mortality since the legalization of abortion in the United States, and by high rates of maternal death and complications in those countries where abortion is still provided under unsafe conditions. The past two decades have brought important advances in abortion care as well as increasing cross-disciplinary use of abortion technologies in women's health care. Abortion is an important option for pregnant women who have serious medical conditions or fetal abnormalities, and fetal reduction techniques are now well-integrated into infertility treatment to reduce the risks of multiple pregnancies resulting from assisted reproductive technologies. **Management of Unintended and Abnormal Pregnancy: Comprehensive Abortion Care** is the textbook of the National Abortion Federation, and serves as the standard, evidence-based reference text in abortion care. This state-of-the-art textbook provides a comprehensive overview of the public health implications of unsafe abortion and reviews the best surgical and medical practices for pregnancy termination, as well as managing ectopic and other abnormal pregnancies. **Management of Unintended and Abnormal Pregnancy: Comprehensive Abortion Care** is the leading source for a comprehensive understanding of issues related to unintended and abnormal pregnancy. **Application of Bovine Rapid Pregnancy Test Kit for the Early Pregnancy Diagnosis in Ewes in Comparison with Progesterone and Pregnancy-specific Protein B Assays** Mar 26 2021 The objective of the experiment was to identify the applicability of TARGET Bovine CL progesterone test kit (TARGET) for early pregnancy diagnosis in ewes. TARGET (BioMetallics, Inc.) is a commercial test kit to identify pregnancy in cows in the field. The test kit diagnostic result was assessed by standard color grade chart. When the blood or milk sample progesterone level is high, the test kit shows a white color and the cow is diagnosed as pregnant. The dark blue color indicates no-pregnancy, whereas the light blue and faint blue together indicate that there is no definite diagnosis, so a second test is required. In this experiment, 132 Merino ewes were divided into two groups. Eighty two ewes were assigned to a spring breeding flock at Rafter 7 Ranch (Yerington, NV), and the other 50 ewes were assigned to a fall breeding flock at Main Station Field Lab (MSFL, Reno, NV). In the Rafter 7 Ranch group, three diagnostic methods were applied to verify the

reliability of the TARGET test kit: ELISA analysis of the blood progesterone level, ultrasound scanning for the pregnancy diagnosis, and the lambing records. An additional test called BioPRYN(Pregnancy Ruminant Yes/No) analysis, which tests PSPB(Pregnancy-Specific Protein B) level in the blood samples, was applied to the MSFL group. TARGET color grade readings, ELISA analysis, BioPRYN test results, ultrasound scanning results, and lambing records were analyzed by the FREQ procedure of the SAS (V 9.2) program to give the phi coefficients. For both groups, the cut-off value of ELISA progesterone assays to diagnose pregnancy in ewes was defined as  $\geq 1$  ng/ml. Six possible combinations within four color grades were evaluated separately. Sensitivity, specificity, and predictive values of TARGET kit color grade assignments for pregnancy diagnosis were calculated. For both groups, the color indicators of the TARGET test kit for early pregnancy diagnosis in ewes showed a significantly high phi coefficient (P
