Designing Better Maps: A Guide for GIS Users, second edition, breaks down the myriad decisions involved in creating maps that communicate effectively. The second edition includes updated material and a new chapter on map publishing. In this catalogue (no. 3 of a series) collectors will find details of more than 1200 different antique maps of Italy, Sardinia, Sicily and the major Italian regions and cities. The maps are listed by region and sub-region in date order, from 1477 to 1850. The prices given are the 2014 rated values, all of which are for maps in fine condition. This enables collectors, for the first time, to compare, at a glance, the importance of all the available maps of any region. Please note that if condition was not standardized, such comparisons could not be made. There is also more information on individual maps, many of which are illustrated in colour. In the five years since the publication of the first edition of A Guide to Effective Map Design, cartography and software have become further intertwined. However, the initial motivation for publishing the first edition is still valid: many GISers enter the field without so much as one hour of design instruction in their formal education. Yet they are then tasked with creating one of the most effective, easily recognized communication tools: a map. See What's New in the Second Edition Projection theory Hexagonal binning Big Data point density maps Scale dependent map design 3D building modeling Digital cartography and its best practices Updated graphics and references Study questions and lab exercises at the end of each chapter In this second edition of a bestseller, author Gretchen Peterson takes a "don't let the technology get in the way" approach to the presentation, focusing on the elements of good design, what makes a good map, and how to get there, rather than specific software tools. She provides a reference that you can thumb through time and again as you create your maps. Copiously illustrated, the second edition explores novel concepts that kick-start your pursuit of map-making excellence. The book doesn't just teach you how to design and create maps, it teaches you how to design and create better maps. Identifies important overland wagon roads used by Americans from about 1735-1815. Whether you are a hobbyist or a professional web developer, if you wish to use maps on your website, then this book is for you. A basic understanding of JavaScript will be helpful, but is not necessary. Working with Map Projections: A Guide to Their Selection explains why, for any given map, there isn't a single "best" map projection. Selecting a projection is a matter of understanding the compromises and consequences of showing a 3-D space in two dimensions. The book presents a clear understanding of the processes necessary to make logical decisions on selecting an appropriate map projection for a given data set. The authors discuss the logic needed in the selection process, describe why certain decisions should be made, and explain the consequences of any inappropriate decision made during the selection process. This book also explains how the map projection will impact the map's ability to fulfill its purpose, uses real-world data sets as the basis for the selection of an appropriate map projection, and provides illustrations of an appropriately and inappropriately selected map projection for a given data set. The authors take a novel approach to discussing map projections by avoiding an extensive inventory of mathematical formulae and using only the mathematics of map projections that matter for many mapping tasks. They also present information that is directly applicable to the process of selecting map projections and not tied to a specific software package. Written by two leading experts, this book is an invaluable resource for anyone studying or working with geospatial data, from students to experienced professionals, and will help readers successfully weigh the pros and cons of choosing one projection over another to suit a map's intended purpose.
