Handbook of Dehumidification Technology is a handbook of

dehumidifiers and how they work. This manual describes the principles of dehumidification and looks at the domestic and industrial applications of dehumidifiers, along with design considerations for refrigerant dehumidifiers. The use of dehumidification in swimming pools and for food and flower storage is also discussed. This reference guide is comprised of 11 chapters and begins with an introduction to dehumidification, paying particular attention to how it addresses the problems created by high water vapor content in air. The historical development of air drying and the use of psychrometric charts to describe the state of damp air as well as to illustrate ways of lowering the relative humidity of moist air are also considered. The next chapter presents three methods of removing moisture from air: sorbent dehumidification, refrigerant dehumidification, and air-cycle dehumidification. The reader is also introduced to design considerations for refrigerant dehumidifiers, domestic applications of dehumidifiers, installation of dehumidifiers in a swimming pool, and industrial dehumidification. The final chapter is devoted to additional sources of information on dehumidifiers and dehumidification, including journals, professional bodies, and research. This monograph will be a valuable resource for technicians and others interested in humidity control. Document from the year 2019 in the subject Forestry / Forestry Economics, grade: 9.0, , course: Plant Pathology, language: English, abstract: This book is a manual on general laboratory handling techniques in plant pathology. It will present different conditions that are essential for those who are interested in working in the field of plant pathology in a laboratory. The analysis in this book focuses on various circumstances like general requirements, laboratory equipments, sterilization techniques, the isolation of bacteria etc. When designing a laboratory there are many aspects to consider. It is important that work should be carried out in a logical order and, that particular parts of the diagnostic protocol are separated from one another. General plant protection laboratory may have the following different rooms and chamber as appropriate. The preparation room is used for preparing media, including sterilizing items in the autoclave, sterilizing petri dishes in an oven, washing glassware and storing glassware, chemicals and other basic items. This room should have an exhaust fan to remove hot air produced by the autoclave and the oven. The clean room is used for isolating fungi and bacteria from cleaned subsamples of diseased plant tissue into pure cultures. It is also used for growing cultures under clean conditions. The microscopes are located in this room for examining cultures and fungal structures. This room should be air-conditioned, if possible, to protect equipment and cultures. It should also be kept free from dust and insects. If, do not have an airtight clean room or humidity will be too high and fungus (mould) will develop on walls and equipment. A dehumidifier is useful in this room. No soil is allowed in the clean room as soil is a source of fungus-eating mites that can contaminate cultures.
