Science Teaching Reconsidered Aug 20 2023 Effective science teaching requires creativity, imagination, and innovation. In light of concerns about American science literacy, scientists and educators have struggled to teach this discipline more effectively. Science Teaching Reconsidered provides undergraduate science educators with a path to understanding students, accommodating their individual differences, and helping them grasp the methodsâ€”and the wonderâ€”of science. What impact does teaching style have? How do I plan a course curriculum? How do I make lectures, classes, and laboratories more effective? How can I tell what students are thinking? Why don't they understand? This handbook provides productive approaches to these and other questions. Written by scientists who are also educators, the handbook offers suggestions for having a greater impact in the classroom and provides resources for further research.

Perkins Activity and Resource Guide - Chapter 4: Functional Academics Jun 18 2023 This chapter is designed to address the needs of individuals with visual and multiple disabilities who may not be able to follow all parts of a traditional academic curriculum. As educators, our primary goal should be to provide students with skills that will be of use throughout their lives. Skill acquisition often takes longer for students with multiple disabilities, and they are not always able to generalize them into other settings. For this reason it is important to identify skills that will help prepare students to lead the most independent lives possible and to provide many opportunities to practice them.

Managing Water Resources in a Time of Global Change Jan 21 2021 Global change possesses serious challenges for water managers and scientists. In mountain areas, where water supplies for half of the world population originate, climate and hydrologic models are still subject to considerable uncertainty. And yet, critical decisions have to be taken to ensure adequate and safe water supplies to billions of people, millions of farmers and industries, without further deteriorating rivers and water bodies. While global warming is known to cause glaciers' retreat and reduced snow packs around the world, it is not clear that mountain discharge will be lower. What is widely recognised is that water management must be adapted to accommodate significant regime changes. However, this inevitably involves managing transboundary rivers, adding further complexity to putting principles in practice. This book takes global warming and the importance of mountain areas in world water resources as the starting point. First, it provides detailed reviews of the processes going on in several rivers systems and world regions in Europe (Rhône and Ebro), North America (Canadian Rockies, Western US and Mexico), the Middle East (Jordan), Africa (Tunisia, Kenya and South Africa). These contexts provide case studies and examples that show the difficulties and potential for adaptation to global change. Land-use, economics, numerous modeling approaches are some of the cross-cutting issues covered in the chapters. The volume also includes the views of water practitioners, with two chapters authored by members of the US-Canada International Joint Commission, an industrialist from Western Canada and an environmental leader in Spain. By combining a rich set of contexts and approaches, the volume succeeds in offering a view of the global challenges faced by water agencies, international donors and researchers around the world. A case is made in some chapters to seek adaptive strategies rather than trying to reduce or control resources variability. This requires factoring in land-use, social and economic aspects, especially in developing countries. Another conclusion is that complex problems can and must be posed and negotiated with the help of models, mapping techniques and science-based facts. However complex these may be, there are ways to translate them to easily interpretable and visualisations of alternative scenarios and courses of action. This book provides numerous examples of the potential of such approaches to draft environmental programmes solve transboundary disputes and reduce the economic consequences of droughts and climate instability.

Linear Programming and Resource Allocation Modeling Oct 10 2022 Guides in the application of linear programming to firm decision making, with the goal of giving decision-makers a better understanding of methods at their disposal Useful as a main resource or as a supplement in an economics or management science course, this comprehensive book addresses the deficiencies of other texts when it comes to covering linear programming theory—especially where data envelopment analysis (DEA) is concerned—and provides the foundation for the development of DEA. Linear Programming and Resource Allocation Modeling begins by introducing primal and dual problems via an optimum product mix problem, and reviews the rudiments of vector and matrix operations. It then goes on to cover: the canonical and standard forms of a linear programming problem; the computational aspects of linear programming; variations of the standard simplex theme; duality theory; single- and multiple- process production functions; sensitivity analysis of the optimal solution; structural changes; and parametric programming. The primal and dual problems are then reformulated and re-examined in the context of Lagrangian saddle points, and a host of duality and complementary slackness theorems are offered. The book also covers primal and dual quadratic programs, the complementary pivot method, primal and dual linear fractional functional programs, and (matrix) game theory solutions via linear programming, and data envelopment analysis (DEA). This book: Appeals to those wishing to solve linear optimization problems in areas such as economics, business administration and management, agriculture and energy, strategic planning, public decision making, and health care Fills the need for a linear programming applications component in a management science or economics course Provides a complete treatment of linear programming as applied to activity selection and usage Contains many detailed example problems as well as textual and graphical explanations Linear Programming and Resource Allocation Modeling is an excellent resource for professionals looking to solve linear optimization problems, and advanced undergraduate to beginning graduate level management science or economics students.

Oligopoly, the Environment and Natural Resources Mar 23 2021 Industrial production and consumption patterns rely heavily on the intensive use of both renewable and non-renewable resources and the consequences for the environment can be serious. Following a long period of time where the profit incentives of firms have prevailed over preservation of the environment and the world's natural

resources, a new consensus has emerged concerning the need to regulate firm behaviour, aimed at ensuring the sustainability of the economic system in the long run. This book offers an exhaustive overview of current economic debate about these topics, taking modern oligopoly theory as a benchmark. The first part of the book covers static models dealing with incentives for green research and development, Pigovian taxation, cartels, environmental quality and international trade, as well as the role of corporate social responsibility, public firms and consumer environmental awareness as endogenous regulatory instruments. Then, the author moves on to examine the role of time while drawing from optimal control and differential game theory. This opens the way to the discussion of fair discount rates to ensure the welfare of future generations, as well as the long run sustainability of production and consumption patterns.

The Art of Problem Solving Nov 30 2021 Problem solving has always been a fundamental element of mathematics. Focusing on problem solving as a subject in its own right, the contributors present a broad range of practical, theoretical, simple, intricate and purely mathematical examples.

Post-Faustmann Forest Resource Economics Nov 18 2020 The current paradigm of forest economics is based on Faustmann Formulation (FF) of land expectation value proposed by Martin Faustmann. It was a great achievement by a forester to propose a formulation that captures some fundamental economic features of capital theory which. However, the followers of the FF approach have trapped themselves into the past, and have not shown any indication of economic acumen of the great Faustmann. This has resulted in a common problem in the current paradigm of forest economics, known as Faustmann Forest Resource Economics (FFRE), to prescribe the application of a single (FF) approach to all situations irrespective of the specific features of the situation. The current state of forest economics is similar to that of neoclassical economics, and is full of inefficiencies. In neoclassical economics, inefficiencies are due to its "locked-in" position in rational economic man, while in forest economics inefficiencies are due to its "locked-in" position in the FF. The focus of this volume is on the new paradigm of forest economics termed as Post-Faustmann Forest Resource Economics (PFFRE). The first chapter lays the foundation of the PFFRE, and presents the key distinctions between the FFRE and the PFFRE. The volume includes twelve other chapters that address issues related to forest economics from perspectives different than the FFRE. Chapter 2 to 6 are focused on issues related to human behavior that is different than the rational economic man, Chapter 7 and 8 on public choice theory, Chapter 9 and 10 on systems approaches, and Chapter 11 to 13 on incremental approaches to incorporate new features in the FFRE.

Realistic Decision Theory May 25 2021 Within traditional decision theory, common decision principles -- e.g. the principle to maximize utility -- generally invoke idealization; they govern ideal agents in ideal circumstances. In Realistic Decision Theory, Paul Weirch adds practicality to decision theory by formulating principles applying to nonideal agents in nonideal circumstances, such as real people coping with complex decisions. Bridging the gap between normative demands and psychological resources, Realistic Decision Theory is essential reading for theorists seeking precise normative decision principles that acknowledge the limits and difficulties of human decision-making.

The Dementia Caregiver Jun 13 2020 Becoming a caregiver for someone with Alzheimer's disease or another neurocognitive disorder can be an unexpected, undesirable, underappreciated—and yet noble role. It is heartbreaking to watch someone lose the very cognitive capacities that once helped to define them as a person. But because of the nature of these disorders, the only way to become an effective caregiver and cope with the role's many daily challenges is to become well-informed about the disease. With the right information, resources and tips on caregiving and working with professionals, you can become your own expert at both caring for your charge and taking care of yourself. In these pages, Marc Agronin guides readers through a better understanding of the changes their loved one may be going through, and helps them tap into the various resources available to them as they embark on an uncertain caregiving journey. Insisting that a caregiver also maintain his or her own health and well being, Agronin guides caregivers in their efforts to provide care, but to also look to themselves as recipients of care from themselves and others. Shedding light on the debilitating disorders themselves as well as their everyday realities, this book is a much-needed resource for anyone caring for another person suffering from Alzheimer's disease and other neurocognitive disorders.

fuels and alternative energy sources with Dunlap's SUSTAINABLE ENERGY, 2nd Edition. Individual chapters thoroughly investigate each energy approach as the book covers both current energy production and future strategies. The author assumes reader familiarity with the basic concepts of freshman-level physics and chemistry. The text emphasizes the complexity of energy issues and the need for a multidisciplinary approach to solving energy problems. Quantitative end-of-chapter problems emphasize analyzing information, correlating data from various sources, and interpreting graphical data and interpolate values. Readers see real problems in producing and using energy as they realize that while exact calculations are important, a broad-based analysis is often most appropriate. Confronting the Nation's Water Problems Feb 14 2023 In order to confront the increasingly severe water problems faced by all parts of the country, the United States needs to make a new commitment to research on water resources. A new mechanism is needed to coordinate water research currently fragmented among nearly 20 federal agencies. Given the competition for water among farmers, communities, aquatic ecosystems and other users-as well as emerging challenges such as climate change and the threat of waterborne diseases-Confronting the Nation's Water Problems concludes that an additional \$70 million in federal funding should go annually to water research. Funding should go specifically to the areas of water demand and use, water supply augmentation, and other institutional research topics. The book notes that overall federal funding for water research has been stagnant in real terms for the past 30 years and that the portion dedicated to research on water use and social science topics has declined considerably.
