February 15, 2016 was the beginning of a debate on man-made climate change between two well-known experts in the field, Dr. William Happer and Dr. David Karoly, hosted by James Barham and his team at TheBestSchools.org. Both have been heavily involved in atmospheric research since the 1980s. Happer believes that burning fossil fuels will have a minimal effect on climate but a large benefit to plant

life and humanity. Karoly believes the opposite. How certain is the conclusion by some scientists that burning fossil fuels will lead to a climate disaster? Only debates can ferret out their certainty or lack of it. Burning fossil fuels may cause some harm, but if we stop burning them, we will face certain harm. Which is worse? Debates educate the public, they are necessary. This is an in-depth look at both sides of the debate between two prominent experts. Council on Foreign Relations This book provides a balanced and comprehensive account of the issues involved in climate change and the range of domestic and foreign policy options available to American policymakers. What if volcanoes are heating the planet? Maybe solar cycles are to blame? Isn't carbon dioxide good for plants? These are but a few of the questions on global warming that are addressed in this book. If you are concerned that global warming may be a serious problem, but find it hard to know what to believe or how to help in the face of conflicting arguments, you will want to read this book. You don't have to be a scientist to understand Dr. Shahir Masri's explanations and solutions. They proceed along common-sense lines that are easy to follow. Climate change poses a major threat to public health and the environment. Yet, political squabbles and misinformation have stalled policy and enabled little progress to be made in solving the crisis. Similarly, the notion of a "climate debate" has created the illusion of a divided scientific community, when in fact most scientists agree that human activity is causing the planet to warm. At a time when open discussion is essential, talk of global warming has become entrenched in politics and all but taboo in unfamiliar company. In *Beyond Debate*, Shahir Masri clears up 50 of the most common misconceptions

surrounding climate change. He simplifies the science and resolves the confusion so that everyone may better understand the issue. Now is not the time for silence, but rather a time for conversation and collective action to address greenhouse gas emissions and begin to solve the climate crisis. Action begins with understanding, which *Beyond Debate* so eloquently offers. Masri conveys a sense of urgency while describing opportunities for hope. University Press returns with another short and captivating book - a brief history of climate change, climate science, and climate debate. Climate change. Climate science. Climate hysteria. Climate denial. Climate debate. We know that the Earth goes through regular cycles of cooling and heating. The question is: Are humans responsible for the latest round of climate change? If humans are responsible, then what, if anything, should humans do about it? According to most climate scientists, climate change has many causes, including - most controversially - the incentives, habits, decisions, and behaviors of human individuals, businesses, and nations. Unfortunately, ignorant climate hysteria has created knee-jerk overreactions and equally ignorant climate denialism. Both extremes are grossly disingenuous. Both extremes ignore the facts, stifle debate, and appeal to lazy minds. The global climate wars may be heated and polarizing, but the world deserves thoughtful, informed debate on a subject of this magnitude. This short book peels back the veil and provides a clear-eyed glimpse into the remarkable history of climate science and its implications for our world today - a glimpse that you can read in about an hour. The author, a professor of Mechanical Engineering, shares his perspectives and conclusions on the topic of climate change. Are the often

alarming claims about global warming based on science and justified by the facts? Is the human race really facing a major crisis due to emissions from fossil fuels? Would the proposed Climate Treaty solve a real environmental threat or would it create worldwide economic and social harm? S. Fred Singer is a distinguished astrophysicist who has taken a hard, scientific look at the evidence. In this new book, Dr. Singer explores the inaccuracies in historical climate data, the limitations of attempting to model climate on computers, solar variability and its impact on climate, the effects of clouds, ocean currents, and sea levels on global climate, and factors that could mitigate any human impacts on world climate. Singer's masterful analysis decisively shows that the pessimistic, and often alarming, global warming scenarios depicted in the media have no scientific basis. In fact, he finds that many aspects of any global warming, such as a longer growing season for food and a reduced need to use fossil fuels for heating, would actually have a positive impact on the human race. Further, Singer notes how many proposed "solutions" to the global warming "crisis" (like "carbon" taxes) would have severe consequences for economically disadvantaged groups and nations. According to Arthur C. Clarke, author of *2001: A Space Odyssey*, *Hot Talk, Cold Science* dares to point out that 'the Emperor has no clothes.' Is there evidence to suggest discernible human influence on global climate? Of great interest, this book demonstrates that, at best, the evidence is sketchy and incomplete. *Hot Talk, Cold Science* is essential reading for anyone who wants to be fully informed about the global warming debate. *The Climate Change Debate: A Reference Handbook* provides an in-depth look at climate change facts and statistics. It also discusses debate surrounding the

scientific consensus. *The Climate Change Debate: A Reference Handbook* covers the topic of climate change from the earliest days of planet Earth to the present day. Chapters One and Two provide a historical background of climate change and a review of current problems, controversies, and solutions. The remainder of the book consists of chapters that aid readers in continuing their own research on the topic, such as an extended annotated bibliography, chronology, glossary, noteworthy individuals and organizations in the field, and important data and documents. The variety of resources provided, such as further reading, perspective essays about climate change, a historical timeline, and useful terms in the climate change discourse, differentiates this book from others in the field. The book is intended for readers of high school through the community college level, along with adult readers who may be interested in the topic. From the front lines of the global warming debate, this book brings together senior perspectives from government, industry, academia and environmental organizations in a provocative discussion of the challenges and implications of our changing climate. This volume of essays fills a lacunae in the current climate change debate by bringing new perspectives on the role of humanities scholars within this debate. The humanities have historically played an important role in the various debates on environment, climate and society. The past two decades especially have seen a resurfacing of these environmental concerns across humanities disciplines in the wake of what has been termed climate change. This book argues that these disciplines should be more confident and vocal in responding to climate change while questioning the way in which the climate change debate is currently being

conducted in academic, political and social arenas. Addressing climate change through the varied approaches of the humanities means re-thinking and re-evaluating its fundamental assumptions and responses to perceived crisis through the lens of history, philosophy and literature. The volume aims thus to be a catalyst for emerging scholarship in this field and to appeal to an academic and popular readership. An introduction to the climate-change debate for non-specialists. Of the two kinds of philosophical questions – epistemic and ethical - raised by the public debate about climate change, professional philosophers have dealt almost exclusively with the ethical. This book is the first to address both and examine the relationship between them. In recent decades agricultural commodity surpluses in the developed world have contributed to a mantra of 'land surplus' in which set-aside, extensification, alternative land uses and 'wilding' have been key terms in debates over land. Quite suddenly all this has changed as a consequence of rapidly shifting commodity markets. Prices for cereals, oil seeds and other globally traded commodities have risen sharply. A contributor to this has been the shift to bioenergy cropping, fuelled by concerns over post-peak oil and climate change. Agricultural supply chain interests have embraced the 'new environmentalism' of climate change with enthusiasm, proudly proclaiming the readiness of the industry to produce both food and energy crops, and to do so with a neo-liberal confidence in markets to determine the balance between food and non-food crops in land use. But policy and politics have not necessarily caught up with these market and industry-led changes and some environmentalists are beginning to challenge the assumptions of the new 'productivism'. Is it necessarily the

case, they ask, that agriculture's best contribution to tackling climate change is to grow bioenergy crops or invest in anaerobic-digesters or make land over for windfarms? Might not there be an equally important role in maximising the carbon sequestration or water-holding properties of biodiverse land? What is *Land For?* tackles these key cutting-edge issues of this new debate by setting out a baseline of evidence and ideas. For lay readers and specialists alike, this concise, scientific analysis refutes the pessimistic global warming scenarios depicted in the media. In addition to covering better-known topics, the book also provides an in-depth examination of less frequently discussed issues including historical climate data inaccuracies, the limitations of computer climate modeling, solar variability, and factors that could mitigate any human impacts on world climate. Potential upsides related to global warming and the financial consequences of many of the proposed solutions are identified. This intriguing volume provides a thorough examination of the historical roots of global climate change as a field of inquiry, from the Enlightenment to the late twentieth century. Based on primary and archival sources, the book is filled with interesting perspectives on what people have understood, experienced, and feared about the climate and its changes in the past. Chapters explore climate and culture in Enlightenment thought; climate debates in early America; the development of international networks of observation; the scientific transformation of climate discourse; and early contributions to understanding terrestrial temperature changes, infrared radiation, and the carbon dioxide theory of climate. But perhaps most important, this book shows what a study of the past has to offer the interdisciplinary

investigation of current environmental problems. Dr James Hansen, the world's leading scientist on climate issues, speaks out for the first time with the full truth about global warming: the planet is hurtling to a climatic point of no return. Hansen - whose climate predictions have come to pass again and again, beginning in the 1980s when he first warned US Congress about global warming - is the single most credible voice on the subject worldwide. He paints a devastating but all-too-realistic picture of what will happen if we continue to follow the course we're on. But he is also a hard-headed optimist, and shows that there is still time to take the urgent, strong action needed to save humanity.

Climate Change: Evidence and Causes is a jointly produced publication of The US National Academy of Sciences and The Royal Society. Written by a UK-US team of leading climate scientists and reviewed by climate scientists and others, the publication is intended as a brief, readable reference document for decision makers, policy makers, educators, and other individuals seeking authoritative information on the some of the questions that continue to be asked. Climate Change makes clear what is well-established and where understanding is still developing. It echoes and builds upon the long history of climate-related work from both national academies, as well as on the newest climate-change assessment from the United Nations' Intergovernmental Panel on Climate Change. It touches on current areas of active debate and ongoing research, such as the link between ocean heat content and the rate of warming. Though the scientific community largely agrees that climate change is underway, debates about this issue remain fiercely polarized. These conversations have become a rhetorical contest, one where opposing sides try

to achieve victory through playing on fear, distrust, and intolerance. At its heart, this split no longer concerns carbon dioxide, greenhouse gases, or climate modeling; rather, it is the product of contrasting, deeply entrenched worldviews. This brief examines what causes people to reject or accept the scientific consensus on climate change. Synthesizing evidence from sociology, psychology, and political science, Andrew J. Hoffman lays bare the opposing cultural lenses through which science is interpreted. He then extracts lessons from major cultural shifts in the past to engender a better understanding of the problem and motivate the public to take action. *How Culture Shapes the Climate Change Debate* makes a powerful case for a more scientifically literate public, a more socially engaged scientific community, and a more thoughtful mode of public discourse. This book examines the arguments made by political actors in the creation of antagonistic discourses on climate change. Using in-depth empirical research from Sweden, a country considered by the international political community to be a frontrunner in tackling climate change, it draws out lessons that contribute to the worldwide environmental debate. The book identifies and analyses four globally circulated discourses that call for very different action to be taken to achieve sustainability: Industrial fatalism, Green Keynesianism, Eco-socialism and Climate scepticism. Drawing on risk society and post-political theory, it elaborates concepts such as industrial modern masculinity and ecomodern utopia, exploring how it is possible to reconcile apocalyptic framing to the dominant discourse of political conservatism. This highly original and detailed study focuses on opinion leaders and the way discourses are framed in the climate change debate, making

it valuable reading for students and scholars of environmental communication and media, global environmental policy, energy research and sustainability. "Unsettled is a remarkable book—probably the best book on climate change for the intelligent layperson—that achieves the feat of conveying complex information clearly and in depth." —Claremont Review of Books "Surging sea levels are inundating the coasts." "Hurricanes and tornadoes are becoming fiercer and more frequent." "Climate change will be an economic disaster." You've heard all this presented as fact. But according to science, all of these statements are profoundly misleading. When it comes to climate change, the media, politicians, and other prominent voices have declared that "the science is settled." In reality, the long game of telephone from research to reports to the popular media is corrupted by misunderstanding and misinformation. Core questions—about the way the climate is responding to our influence, and what the impacts will be—remain largely unanswered. The climate is changing, but the why and how aren't as clear as you've probably been led to believe. Now, one of America's most distinguished scientists is clearing away the fog to explain what science really says (and doesn't say) about our changing climate. In *Unsettled: What Climate Science Tells Us, What It Doesn't, and Why It Matters*, Steven Koonin draws upon his decades of experience—including as a top science advisor to the Obama administration—to provide up-to-date insights and expert perspective free from political agendas. Fascinating, clear-headed, and full of surprises, this book gives readers the tools to both understand the climate issue and be savvier consumers of science media in general. Koonin takes readers behind the headlines to the more nuanced science

itself, showing us where it comes from and guiding us through the implications of the evidence. He dispels popular myths and unveils little-known truths: despite a dramatic rise in greenhouse gas emissions, global temperatures actually decreased from 1940 to 1970. What's more, the models we use to predict the future aren't able to accurately describe the climate of the past, suggesting they are deeply flawed. Koonin also tackles society's response to a changing climate, using data-driven analysis to explain why many proposed "solutions" would be ineffective, and discussing how alternatives like adaptation and, if necessary, geoengineering will ensure humanity continues to prosper. *Unsettled* is a reality check buoyed by hope, offering the truth about climate science that you aren't getting elsewhere—what we know, what we don't, and what it all means for our future. This volume takes a distinctive look at the climate change debate, already widely studied across a number of disciplines, by exploring the myriad linguistic and discursive perspectives and approaches at play in the climate change debate as represented in a variety of genres. The book focuses on key linguistic themes, including linguistic polyphony, lexical choices, metaphors, narration, and framing, and uses examples from diverse forms of media, including scientific documents, policy reports, op-eds, and blogs, to shed light on how information and knowledge on climate change can be represented, disseminated, and interpreted and in turn, how they can inform further discussion and debate. Featuring contributions from a global team of researchers and drawing on a broad array of linguistic approaches, this collection offers an extensive overview of the role of language in the climate change debate for graduate students, researchers,

and scholars in applied linguistics, environmental communication, discourse analysis, political science, climatology, and media studies. Benefits The volume establishes a dynamic interplay between two high-level research fields: humanistic climate studies and genre research The volume offer an understanding of the way the structural and ideological issues in the debate over anthropogenic climate change are determined by the genres in play in the debate. The volume continues key developments in contemporary genre research, in particular the use of genre in political campaigning and the uptake of genre information and action across genre systems. The greatest conundrum concerning anthropogenic climate change may prove to be in the humanities and the social sciences. How is it even possible that highly exigent information for which overwhelming evidence exists does not make an immediate and strong impact on ideologies, policies, and life practices across the globe? This volume offers an intriguing and enlightening new approach to the the climate debate by taking it as a question of genre. Genres are the cultural categories that structure human understanding and communication, and genre research therefore offers a central key to unlocking the conundrum. From a genre perspective, if there is one thing the climate debate demonstrates, it is the inertia inherent in genre use. Patterns of understanding and interpretation once established seem to carry on even when they have long outlived their usefulness. However, it is also evident that uses of genre can work to change this inertia. Genres play a vital role in human interaction, as we use them to learn, express ourselves, and to act. How individual actors utilize or manipulates genres determines to what extent knowledge

of climate change spreads from the scientific community to the public, how it is debated, and to what extent it leads to positive action. Frequently presented as a historic last chance to set the world on a course to prevent catastrophic climate change, the 21st Conference of the Parties to the Climate convention (COP21) was a global summit of exceptional proportions. Bringing together negotiators, scientists, journalists and representatives of global civil society, it also constituted a privileged vantage point for the study of global environmental governance "in the making". This volume offers readers an original account of the current state of play in the field of global climate governance. Building upon a collaborative research project on COP21 carried out by a multidisciplinary team of twenty academics with recognised experience in the field of environmental governance, the book takes COP21 as an entry point to analyse ongoing transformations of global climate politics, and to scrutinise the impact of climate change on global debates more generally. The book has three key objectives: To analyse global climate governance through a combination of long-term analysis and on-site observation; To identify and analyse the key spaces of participation in the global climate debate; To examine the "climatisation" of a series of crosscutting themes, including development, energy, security and migration. This book will be of great interest to students, scholars and policymakers of climate politics and governance, international relations and environmental studies. Climate change is not 'a problem' waiting for 'a solution'. It is an environmental, cultural and political phenomenon which is re-shaping the way we think about ourselves, our societies and humanity's place on Earth. Drawing upon twenty-five years of professional work

as an international climate change scientist and public commentator, Mike Hulme provides a unique insider's account of the emergence of this phenomenon and the diverse ways in which it is understood. He uses different standpoints from science, economics, faith, psychology, communication, sociology, politics and development to explain why we disagree about climate change. In this way he shows that climate change, far from being simply an 'issue' or a 'threat', can act as a catalyst to revise our perception of our place in the world. *Why We Disagree About Climate Change* is an important contribution to the ongoing debate over climate change and its likely impact on our lives. What role could or should the law play in dealing with the climate emergency? In this innovative volume, leading scholars explore fundamental debates at the frontier of climate change law scholarship. They address the key areas of scholarly disagreement about what climate change law is, the legal rules it consists of, and how these rules could be implemented in the real world. The first eleven topics are debated by teams of scholars expressing diametrically opposite points of view on each topic, in traditional debating style; the last seven chapters are presented as an individual author's own reflection on a topic that cannot readily be reduced to a binary debate. Each chapter is written in an accessible and thought-provoking way, emphasizing clear lines of argumentation. The debating-style format is designed to stimulate students to think critically and logically about the law and to fire up debate in and out of class. Most published books are one-sided in the climate debate between alarmists and skeptics. My book on the climate debate presents both sides of the debate with considerable technical detail and weighs the supporting

evidence. It is found that in general, the data in climatology are very sparse and noisy. Yet climatologists seem willing to draw a dollar's worth of conclusions from a penny's worth of data. The sad truth is that we don't really have good answers to the questions raised in the climate debate. My book shows why this is so. This new edition includes hundreds of references not included in the original version, and the book is expanded by more than 100 pages.

7.2 million YouTube viewers can't be wrong: A provocative new way to look at the global warming debate. Based on a series of viral videos that have garnered more than 7.2 million views, this visually appealing book gives readers—be they global warming activists, soccer moms, or NASCAR dads—a way to decide on the best course of action, by asking them to consider, "What's the worst that could happen?" And for those who decide that action is needed, Craven provides a solution that is not only powerful but also happens to be stunningly easy. Not just another "change your light bulb" book, this intriguing and provocative guide is the first to help readers make sense—for themselves—of the contradictory statements about global climate change. The globe is warming! or The globe is not warming. We're the ones doing it! or It's a natural cycle. It's gonna be a catastrophe! or It'll be harmless. This is the biggest threat to humankind! or This is the biggest hoax in history. Watch a Video

This is a thought-provoking, well-balanced presentation of the debate on global warming. People who hold the view that global warming is a crisis, point to temperature changes in the ocean, raised CO<sub>2</sub> levels, and other evidence that directly ties global warming to human industrialization. Critics of this argument point to a natural, cyclical interglacial period occurring, arguing the influence

of the earth's orbit and solar output fluctuations. Who is right? Scientists, world leaders, and political leaders weigh in. Contemporary Climate Change Debates is an innovative new textbook which tackles some of the difficult questions raised by climate change. For the complex policy challenges surrounding climate migration, adaptation and resilience, structured debates become effective learning devices for students. This book is organised around 15 important questions, and is split into four parts: What do we need to know? What should we do? On what grounds should we base our actions? Who should be the agents of change? Each debate is addressed by pairs of one or two leading or emerging academics who present opposing viewpoints. Through this format the book is designed to introduce students of climate change to different arguments prompted by these questions, and also provides a unique opportunity for them to engage in critical thinking and debate amongst themselves. Each chapter concludes with suggestions for further reading and with discussion questions for use in student classes. Drawing upon the sciences, social sciences and humanities to debate these ethical, cultural, legal, social, economic, technological and political roadblocks, Contemporary Debates on Climate Change is essential reading for all students of climate change, as well as those studying environmental policy and politics and sustainable development more broadly. "The second edition of Dessler and Parson's acclaimed book provides an integrated treatment of the science, technology, economics, policy, and politics of climate change. Aimed at the educated non-specialist, and at courses in environmental policy or climate change, the book clearly lays out the scientific foundations of climate change, the issues in current policy debates, and

the interactions between science and politics that make the climate change debate so contentious and confusing. This new edition is brought completely up to date to reflect the rapid movement of events related to climate change. In addition, all sections have been improved, in particular a more thorough primer on the basic science of climate change is included. The book also now integrates the discussion of contrarian claims with the discussion of current scientific knowledge; extends the discussion of cost and benefit estimates; and provides an improved glossary"--Provided by publisher. "Looks at how we as humans think, individually and collectively, about the climate change debate. The essays throughout are organized around our relationship with nature, the challenges facing human society, and the path ahead for civilization"--Provided by publisher. Published by Pacific Research Institute, 177 Post Street, San Francisco, CA 94108. Balling (geography, Arizona State U.), presents and explains the climatological data and contends that now is the time for more science, not extensive policy changes. Explore the evidence and opinions behind the headlines on climate change. Read scientific explanations about the causes and effects of Earth ' s changing climate and understand the political context. Then, decide where YOU stand on this important issue. The Shaping the Debate series is designed to help readers in grades 5-9 understand social issues from multiple viewpoints and to articulate their own opinions. Each book in this series explains the title issue and how it affects people and policy; introduces people and movements involved in bringing awareness to the issue; highlights applicable major U.S. laws, judicial decisions, and progressive to moderate to conservative viewpoints; and touches on global implications of activism, awareness, and policy change. Dispels much of the science fiction of global warming and the greenhouse effect. Climate change has an impact on the ability of transboundary water management institutions to deliver on their respective mandates. The starting point for this book is that actors within transboundary water management institutions develop responses to the climate change debate, as distinct from the physical phenomenon of climate change. Actors respond to this debate broadly in three distinct ways – adapt, resist (as in avoiding the issue) and subvert (as in using the debate to fulfil their own agenda). The book charts approaches which

have been taken over the past two decades to promote more effective water management institutions, covering issues of conflict, cooperation, power and law. A new framework for a better understanding of the interaction between transboundary water management institutional resilience and global change is developed through analysis of the way these institutions respond to the climate change debate. This framework is applied to six river case studies from Africa, Asia and the Middle East (Ganges-Brahmaputra, Jordan, Mekong, Niger, Nile, Orange-Senqu) from which learning conclusions and policy recommendations are developed.
