This monograph communicates the results of a short-term review of how selected Department of Defense (DoD) components currently review and analyze manpower needs in particular organizations or personnel communities. We reviewed published material and conducted interviews to ascertain useful methods that might be used more widely. The research is not designed to be comprehensive or to review routine Service manpower determination methods. Instead, we are particularly interested in practices that are currently being used by DoD organizations that have yielded specific results. First Published in 2005. Since the breaching of the Berlin Wall in 1989 and the subsequent end of the Cold War, there has been a marked increase in attention paid to multinational military forces. Adelphi Paper 294 looks at the problems facing multinational forces and operations and the prospects for the future. This note describes an application of the subjective transfer function (STF) approach to complex system analysis to an Air-Force-Wide Mission Area Analysis (AFWMAA) problem domain. Following a short description of the background that led up to the research and an overview of the STF approach, the authors discuss how the STF approach was applied to the AFWMAA problem domain of immediate targeting for battlefield air interdiction in the tactical command and control mission area. That section includes: the hypothesized structure of the problem domain; how the judgment data were gathered; the judgment models entertained as STFs to explain how the components comprising the structure affect judged outcomes; how the data were analyzed to provide information about the appropriateness of the hypothesized structure and the appropriate STFs for functionally linking the components of the structure; and how resulting STFs would be used to assess the capabilities of alternative command and control systems. Finally, the significant features of the STF approach are described and a brief summary is presented. (Author). The sixth edition of this classic text retains the best from earlier editions and adds thirteen new selections that highlight twenty-first century challenges, including terrorism and weapons of mass destruction. Strategies for using force, together with case studies that illustrate the general principles, are hallmarks of the text. New case studies include Kosovo, Afghanistan, Iraq, and South Asia. An entirely new section devoted to 'coping with terrorism' looks at the issue from a variety of

geographical and philosophical viewpoints. One of the most important elements of U.S. military strategy for the past 10 years has been the belief that a force able to fight two nearly simultaneous major theater wars of the DESERT STORM type would be capable of dealing with the full gamut of security challenges that the United States is likely to face. These essays from a wide range of scholars, analysts, government officials, and uniformed thinkers represent their views of the question of a force shaping paradigm for the U.S. military. They vary widely on assumptions, analytical parameters, and recommendations. Historically, the United States Army has had difficulty articulating and justifying force requirements to civilian decision makers. Most recently, the wars in Afghanistan and Iraq reinvigorated the debate over estimated force requirements. Because Army planners have failed numerous times to provide force estimates acceptable to the President, the question arises, why are the planning methods inadequate and why have they not been improved? Research began by thoroughly evaluating current doctrinal methods for determining force requirements to determine the rationale for their creation. Army doctrinal publications and research papers published by government and civilian agencies defined key terms, the planning need at the time the methods were developed, and the concepts that influenced the development of the various methods. The research found that current Army doctrine does not provide a coherent theoretical method for determining force density requirements in contemporary operating environments. Instead, doctrine developers have defined three distinct and separate methods for determining force requirements: Correlation of Forces Model (COFM), Relative Combat Power Analysis (RCPA), and Troops-to-Task (T2T). As distinct processes relegated to specific operational situations, they cannot provide a comprehensive picture of force requirements. The DCS/Personnel does not presently have an objective force plan, quantitatively described, against which policy changes can be measured and alternative management actions evaluated. The purpose of analysis was to aid in filling this void by constructing models that structure total officer force profiles under various conditions. The study was conducted in two separate but simultaneous sections described in separate volumes--the static section and the dynamic section. The static model, described in volume 1, enables comparisons to be made between total force profiles that result when different values are assumed for the force parameters. By comparing the resulting profiles, the properties of the total force and the interactions between the force parameters can be clarified. (Author). This report examines U.S. decisions related to the development or use of special operations forces. It should assist in future planning and execution by the Army Special Operations Forces, the U.S. Army, and the joint special operations community. What Force field analysis events should you attend? The BALFRAM Program Maintenance Manual provides the maintenance programmer personnel with the information necessary to maintain the BALFRAM program system effectively. BALFRAM provides the framework within which problems of force requirements and capabilities can be analyzed. The software system furnishes a technique for modeling the engagement of opposing military forces and estimating the expected value outcome of such engagements. Despite recent attempts by scholars to examine the absolute prohibition of threats of force under Article 2(4) of the UN Charter, threats remain a largely un-chartered area in international law when compared with actual uses of force. Adopting an interdisciplinary approach and utilising strategic literature and international relations theory, this book examines the theoretical nature behind a threat of force, which, helps to inform and explain why and how the normative structure operates in the way that it does. In addition to considering the normative rules regarding threats of force, this book focuses heavily on understanding the theory of threats of force or "threat theory". Drawing on strategic studies for an insight into practical workings of international law, the heart of the book examines whether international law, or indeed the international community, should distinguish between a threat of force which is little more than mere "sabre rattling" and one that is serious enough to send a state to DEFCON 1. Finally, the book considers the point at which a state pursuing nuclear capabilities may breach Article 2(4) with particular reference to both North Korean and Iranian efforts to pursue nuclear technology. This topical book will be of great interest not only to scholars and postgraduates in international law but also to academics and students in the fields of political science, international relations and strategic studies. This book addresses how to conduct policy analysis in the field of national security, including foreign policy and defense strategy. It is a philosophical and conceptual book for helping people think deeply, clearly, and insightfully about complex policy issues. This books reflects the viewpoint that the best policies normally come from efforts to synthesize competing camps by drawing upon the best of each of them and by combining them to forge a sensible whole. While this book is written to be reader-friendly, it aspires to in-depth scholarship. The proliferation of weapons of mass destruction, high yield conventional explosives and information warfare technology increasingly threatens American lives, national security and economic infrastructure. The scale of destructive potential which these threats engender requires decisionmakers to search for other policy options beyond diplomacy and after- the-fact reprisals. U.S. leaders must consider military preemption as a viable, sometimes necessary, method of intervention to prevent unacceptable loss of life or damage to essential institutions. U.S. leaders must consider military preemption as a viable, sometimes necessary, method of intervention

to prevent unacceptable loss of life or damage to essential institutions. This book sets out the major social scientific approaches to the study of Special Operations Forces. Despite consistent downsizing, over the past two decades the armed forces of the industrial democracies have seen a huge growth in Special Operations Forces (SOF). Through increasing numbers of personnel and more frequent deployments, SOF units have wielded considerable influence in conflicts around the world, with senior SOF officers having led major strategic operations. This increased presence and unprecedented expansion for SOF is largely a result of the 'new' kinds of conflicts that have emerged in the 21st century. At the same time, even with this high profile in the military, policy and media and popular cultural arenas, there is relatively little social scientific research on SOF. This volume aims to fill this gap by providing a series of studies and analyses of SOF across the globe, since the end of World War II. Analysing SOF at the micro, mezzo and macro levels provides broad and diverse insights. Moreover, the volume deals with new issues raised by the use of such forces that include emerging modes of civilian control, innovative organizational forms and the special psychological characteristics necessitated by SOF operatives. It concludes with a discussion of a question which continues to be debated in today's militaries: what makes SOF 'special'? Filling a clear gap in the literature, this book will be of much interest to students of strategic studies, civil-military relations, irregular warfare, security studies, and international relations. The objective of the dynamic phase of the Officer Force Analysis is to provide a useable analytic personnel tool that will aid in developing improved personnel policy and plans and to exercise this tool in the analysis of various alternatives of current interest. This phase of the total effort will provide a method of describing and studying the problems extant during the transition from the current force to some future force under a given set of policies and plans. (Author). The book is limited in a final sense. In order to maintain 'objectivity' and permit the statistical analyses to proceed in a feasible way, no attempt was made to examine the propriety of the goals selected by U.S. policymakers. Admittedly, this is a separate issue, and the authors carefully note that this was not their concern. However, one cannot really evaluate the effectiveness of the U.S. armed forces without eventually asking whether or not the effects of their use have been beneficial or detrimental to American interests. In particular, Force Without War does not devote any serious attention to the potential costs of using force, even apart from the economic burdens. The use of force for limited objectives can create adversaries where none existed before, extend commitments beyond the original intentions of the policymakers initiating its use, and provoke increases in the military capabilities of potential foes. While measuring the costs of the political use of the armed forces was not an explicit goal of the authors of Force Without War, omitting any consideration of this factor further weakens the conclusions that can be drawn from the study. Much of this review has been quite critical, and a number of virtues of Force Without War have not been singled out. Attempting to provide both a complete record of U.S. political-military responses and a creative explanatory theory that can help us understand the utility of military force is a quite ambitious task. "This dissertation develops a framework of analysis that integrates the most important insights from both the theoretical and the practical/policy-oriented schools of thought on decisions to employ force. It seeks to answer the following question: What are the critical variables to be investigated when analyzing a decision to use military force? It also treats the decision to use force as a separate entity and analyzes it from its own perspective"--Page xv1. The volume shows how economic analysis can explain the causes, conduct, and consequences of conflict. The report presents general information about the capabilities of the Balanced Force Requirements Analysis Model (BALFRAM) for senior military planners, and detailed instructions in the use of BALFRAM for analysts who use the model. Although the report was prepared for use at the Headquarters of the Commander in Chief Pacific (CINCPAC), it is applicable to the use of BALFRAM at other commands and facilities. The more general section describes BALFRAM philosophy and structure, including how it accommodates scenario geography, force characteristics and contingency logic. It also summarizes the computer equipment and software requirements and operating procedures. The detailed instructions specify each program input item, or descriptors in detail.

Appendixes include a glossary, an explanation of the differential fight laws upon which attrition computations are based, and an explanation of how exogenous firepower effectiveness is computed. The role of the United States and its global military presence are under debate in the face of changing strategic and economic realities. The authors present a menu of global postures and compare them in terms of the U.S. Air Force bases, combat forces, active-duty personnel, and base operating costs. Ultimately, the choice will depend on perspectives on the role overseas military presence can play in achieving U.S. global security interests. This book identifies and explains the functional and ideational boundaries regarding what states and Private Military and Security Companies (PMSCs) both do and possess regarding land power, sea power, and air power. Whereas the mercenaries, privateers, and chartered companies of years past held similar characteristics to state military forces, the PMSCs of today are dissimilar for two reasons: a conventional forces norm amongst states and a state proclivity towards the offensive. These factors reveal both the limitations of and the possibilities for contemporary security privatization. This volume is ideal for civilian and military practitioners and students wishing to develop a detailed understanding of what the private military and security industry has to offer and why it is structured the way it is. "In a dangerous world, we need to think very carefully about how military force is used. Game theory can serve us in such analyses by providing a framework for probing the inextricable connections between our adversaries' decision problems and our own. To illustrate the power of game theory, the author focuses on a vital question that confronts American policymakers today: what determines why an application of military force, which was intended to deter potential adversaries, sometimes instead stimulates them to more militant reactions against us? When we feel that force is necessary, what can we do to minimize the risk of such adverse reactions?" -- p. v. Provides an analytic framework and procedure for the intelligence analysis of irregular warfare (IW) environments that can serve as the basis for IW intelligence curriculum development efforts. Defines IW in terms of two stylized situations: population-centric (such as counterinsurgency) and counterterrorism. Provides a detailed review of IW-relevant defense policy and strategy documents and a list of relevant doctrinal publications.
