This book introduces young researchers to the exciting field of ultra-high energy astrophysics including charged particles, gamma rays and neutrinos. At ultra-high energy the radiation is produced by interactions of cosmic ray particles accelerated in explosive events such as supernovae or hypernovae, black holes or, possibly, the big bang. Through direct contact with senior scientists, now actively planning the next generation of experiments/models, the excitement and motivation for research at ultra-high energy was conveyed. The underpinning of these fields is a synthesis of knowledge and techniques from nuclear and particle physics, astronomy and cosmology. Informing the participants of this background, how it was derived, and the new challenges for the future are the major goal. Further, the course has helped to foster new astrophysical research and promoted contacts, which have resulted in new collaborations. Fürstengräber - Elite. Diminutive marvels of artistry and fine craftsmanship, portrait miniatures reveal a wealth of information within their small frames. They can tell tales of cultural history and biography, of people and their passions, of evolving tastes in jewelry, fashion, hairstyles, and the decorative arts. Unlike many other genres, miniatures have a tradition in which amateurs and professionals have operated in parallel and women artists have flourished as professionals. This richly illustrated book presents approximately 180 portrait miniatures selected from the holdings of the Cincinnati Art Museum, the largest and most diverse collection of its kind in North America. The book stresses the continuity of stylistic tradition across Europe and America as well as the vitality of the portrait miniature format through more than four centuries. A detailed catalogue entry, as well as a concise artist biography, appears for each object. Essays examine various aspects of miniature painting, of the depiction of costume in miniatures, and of the allied art of hair work. Paläoökonomie - Schweiz - Neolithikum. The traditional purpose of the Adriatic Meeting is to present most advanced scientific research conducted by the lecturers who take part in the development of their fields and, in addition, to provide a school-like atmosphere for young scientists. Dubrovnik, as a geographical centre of this region of Europe, provided a most adequate location for this conference. Having very agreeable surroundings, the conference site nevertheless gave a focus for very strong scientific interaction. The subjects chosen for the 8th meeting, in September 2001, were gauge theories, particle phenomenology, string theories and cosmology. We were able to bring together a very good cross section of outstanding scientists who gave extraordinarily good presentations. Certainly one reason for this success is that most of us feel obliged to help the scientific life in South East Europe return to its former level. However, there are very exciting new scientific developments as well. Part of the meeting was dominated by neutrino physics which has just seen exciting progress by establishing neutrino masses experimentally. This was discussed within neutrino masses and grand unified theories (GUTs). General aspects of neutrino physics and CP violation, neutrino mixing and the baryon asymmetry were presented along the same lines. On the theoretical side the idea of the construction of gauge theories on non-commutative spaces and their phenomenological implications is accepted worldwide within the particle physics community. This study focuses on the alternating phases of occupation and abandonment of lake-dwellings within the Alpine region, in particular on Lake Constance and Lake Zurich. This book provides an overview of many of the dramatic recent developments in the fields of astronomy, cosmology and fundamental physics. Topics include observations of the structure in the cosmic background radiation, evidence for an accelerating Universe, the extraordinary concordance in the fundamental parameters of the Universe coming from these and other diverse observations, the search for dark matter candidates, evidence for neutrino oscillations, space experiments on fundamental physics, and discoveries of extrasolar planets. This book will be useful for researchers and graduate students who wish to have a broad overview of the current developments in these fields. The Adriatic Meetings have traditionally been conferences on the most advanced status of science. They are one of the very few conferences in physics aiming at a very broad participation of young and experienced researchers with different backgrounds in particle physics. Particle physics has grown into a highly multi-faceted discipline over the sixty years of its existence, mainly because of two reasons: Particle physics as an experimental science is in need of large-scale laboratory set-ups, involving typically collaborations of several hundreds or even thousands of researchers and technicians with the most diverse expertise. This forces particle physics, being one of the most fundamental disciplines of physics, to maintain a constant interchange and contact with other disciplines, notably solid-state physics and laser physics, cosmology and astrophysics, mathematical physics and mathematics. Since the expertise necessary in doing research in particle physics has become tremendously demanding in the last years, the field tends to organize purely expert conferences, meetings and summer schools, such as for detector development, for astroparticle physics or for string theory. The Adriatic Meeting through its entire history has been a place for exchanging exchange between theory and experiment. The 9th Adriatic Meeting successfully continued this tradition and even intensified the cross-discipline communication by establishing new contacts between the community of cosmologists and of particle physicists. The exchange between theorists and experimentalists was impressively intensive and will certainly have a lasting effect on several research projects of the European and world-wide physics community. This book shows that the Southern Question is far from just an Italian issue, for its origins are deeply connected to the formation of European cultural identity between the mid-eighteenth and late-nineteenth centuries."--Jacket. Containing the Proceedings of the Third International Conference on Physics Beyond the Standard Model, this book reports the latest experimental and theoretical results and ideas in this exciting field, at the interface between particle physics, astrophysics, and nuclear physics. Taken as a whole, this book presents an overview of the current status of the field and a valuable analysis of future trends in theory and experimental approaches across particle astrophysics. At once controversial and intriguing, Spiritualism has spread from the United

States to become a global movement. Bringing together perspectives from within the movement and without, this unique collection treats readers to insights about Spiritualism's history, belief, and practice. Based on the belief that the dead can communicate with the living through mediums, Spiritualism touches concepts as timelessly fascinating as human mortality and the continuing existence of the soul beyond bodily death. This comprehensive work will help readers parse the mysteries of this uniquely American religion through three thematically organized volumes: Spiritualism in the U.S. and Globally, Evidence and Beliefs, and Cultural and Social Issues. Drawing on fields as diverse as psychology, sociology, religious studies, anthropology, history, ethnic and gender studies, literature, and art, this broad-based collection frames Spiritualism through the views of a team of international scholars. Among the many things that separate Spiritualism from mainstream religions is the involvement of women in central leadership roles. Such cultural and political elements of the movement are one aspect of this study. Of equal interest to believers and skeptics alike will be the work of scholars who have devoted themselves to examining the claim that communication through mediums proves the existence of life after death. The Fourth International Conference on Particle Physics Beyond the Standard Model (BEYOND THE DESERT '03 - Accelerator, Non-accelerator and Space Approaches) was held during June 9-14, 2003 at Castle Ringberg, Tegernsee, Germany. Traditionally the Scientific Program of the BEYOND conferences, which we started in 1997, covers most of the prominent topics of modern particle physics and astrophysics (see CERN Courier November 1997, pp. 16-18, and March 2003, pp. 29-30). At this conference one of the topics on which we put major emphasis were new theoretical developments in extensions of the Standard Model by Supergravity - which had its twentieth birthday in this year -, by Superstrings and by Extra Dimensions. Two of the 'inventors' of the first superspace formulation of supergravity - Pran Nath and Richard Arnowitt- were participants at this meeting. These topics were discussed by Pran Nath (Boston), Dick Arnowitt (Texas A&M) - who concentrated on the connection to dark matter and g-2 of the muon -, A. E. Faraggi (Oxford, UK), R. E. Allen (Texas A&M) and A. Kobakhidze (Helsinki Univ. ). Fundamental symmetries, including CP violation beyond the Standard Model, a possible time variation of the QCD scale, and the status of preons, were discussed by Peter Herczeg (Los Alamos), M. N. Rebelo (Lisboa, Portugal), R. Lehnert (Algarve Univ., Portugal), Harald Fritzsch (Munich) and S. Fredriksson (Lulea Univ., Sweden)." This book contains the proceedings of the Fifth International Conference on Physics Beyond the Standard Models of Particle Physics, Cosmology and Astrophysics. It presents a brilliant overview of the status and future potential and trends in experimental and theoretical particle physics, cosmology and astrophysics, in the complimentary sectors of accelerator, non-accelerator and space physics. The Fourth HEIDELBERG International Conference on Dark Matter in Astro and Particle Physics, DARK2002, was held in Cape Town, South Africa, in the period 4-9 February 2002. This majestic natural area was the site of the first conference of this series (hosted since 1996 in Heidelberg) to be held outside of Germany. Dark Matter has become one of the most exciting and central fields of astrophysics, particle physics and cosmology. The conference covered, as usual for this series, a large range of topics, theoretical and experimental. Topics included Astronomical Evidence for Dark Matter, the Cosmic Microwave Background, Supersymmetry, Inflation and Dark Energy, Structure Formation, Hot and Cold Dark Matter, and Ultrahigh Energy Cosmic Rays all of which were represented by experts in the field. It was very nice to see again many of our 'old' friends in Dark Matter here in South Africa. The organizers were very glad to see, in addition to world experts, the new generation here. Many young participants gave very nice professional talks during the conference. We are grateful to John Ellis for doing an incredible job preparing his excellent summary talk during the sessions. Some special interest and intensive discussions were naturally raised by the first announcement of terrestrial evidence for hot dark matter, obtained from neutrino less double beta decay. This now adds to the evidence for cold dark matter which we have from DAM A for several years already, and which remained unchallenged up to now by other experiments. Advances in Microbial Physiology is one of the most successful and prestigious series from Academic Press, an imprint of Elsevier. It publishes topical and important reviews, interpreting physiology to include all material that contributes to our understanding of how microorganisms and their component parts work. First published in 1967, it is now in its 54th volume. The Editors have always striven to interpret microbial physiology in the broadest context and have never restricted the contents to "traditional views of whole cell physiology. Now edited by Professor Robert Poole, University of Sheffield, Advances in Microbial Physiology continues to be an influential and very well reviewed series. \* 2006 impact factor of 7.818, placing it 7th in the highly competitive category of microbiology \* Contributions by leading international scientists \* The latest research in microbial physiology
